From: Barry N1EU
Topic: 5640 Message: 5651

Bob, I installed the fan in conjunction with installing the EBS bias mod.
I knew the amp would run hotter after the mod.

73,
Barry N1EU

Topic: 5640 Message: 5652

Bob, according to the install document from Bulgaria, the external dc fan runs all the time but runs faster above 90 deg C. ???

"The external fan is running all the time while the amplifier is ON. . .

Using DC types is preferable since they are controlled at two speed levels, depending on the exhaust air temperature. Running speed is accelerated above 90deg.C (194F) and is automatically slowed down when the cooling air temperature drops below 80deg.C (176F)."

The external fan runs all the time. If it didn't it would be a partial obstruction to air flow. It barely makes any noise – very quiet. My fan was installed was installed at Array Solutions when I bought the 2000A. I have never seen it go to "high speed" ever.

Barry,

The fan only comes on when the amp is too hot.

I installed an external fan on mine, and I have only had it run once.

It was in the summer, without air conditioning on, and it was in the 90's
in the shack - and I was running RTTY calling long CQ's.

When it came on, it surprised the heck out of me.

Why are you installing this fan? Is your amplifier overheating?

-Bob

5654. Acom Service

Yahoo group: acom-list (2010 — 2016)
Date: 2013-11-02 23:50:17 UTC
From: <la4wka@...>
Topic: 5654 Message: 5654

Hello Group.

I just had a failure on my 10 year old Acom -2000A.
Called the dealer and he told me to contact Acom in Bulgaria.
Came in contact with Val (LZ1VB)
I am totally surpriced at what a high level of service Acom still provide for a unit this age!
He guided me trough a set of diagnostics and found the failure trough email.
Was able to fix the problem myself once found, but again I am truly happy that Acom takes the time and treat customers like I have been.
Thank You Val!

Hugo / LA4WKA

Hi Hugo,

I can only completely agree, both Val and Stan and the team at Acom are just second to none. We are dealers for Acom here in Australia and these guys send information that makes our life so easy, especially when its rare for an Acom to go faulty generally. The break between repairs means that you never become entirely conversant with every facet of repair requirements but the truth is, with Acoms help, you can deal with everything on a case by case basis and be very successful every time. And I agree, even if you are not an dealer like ourselves, if you have a reasonable background in Electronics and specifically follow the precautions of Valve amplifiers and residual voltages, then it is a very easy amplifier to work around. * I cant stress enough though that lethal voltages are inside that great performing box so pulling the power and walking away for 30 mins is essential and saves any nasty issues.* I had one amp the other day that was so simple to fix only because of Val and Stans great tutorial and photos that assist you all the way to a successful completion. One 10 ohm 10 watt wire wound resistor, $1 part here in Australia, and all up and running. And the amp had been faultless since 2006. Not bad at all... I sometimes wish i could spend a month in Bulgaria with these guys, the knowledge that you would take on board would be incredible.

So a big thumbs up to Acom as well from Australia, these guys are fantastic.
Cheers
Brenton

From: Bob Naumann
Topic: 5640 Message: 5658

This depends on the “vintage” of your amplifier.

Originally, the fan only would run when the temperature would exceed a pre-set threshold.

Newer versions of the 2000A operate differently.

I will have to research when the change in design was made.

Subject: Re: [acom-list] "External" fan install question (2000A)

Bob, according to the install document from Bulgaria, the external dc fan runs all the time but runs faster above 90 deg C. ???

"The external fan is running all the time while the amplifier is ON. . .

Using DC types is preferable since they are controlled at two speed levels, depending on the exhaust air temperature. Running speed is accelerated above 90deg.C (194F) and is automatically slowed down when the cooling air temperature drops below 80deg.C (176F)."

Big mistake.

With the EBS mod, you have voided all warranty.

Acom specifically states that they do not recommend this modification and that it voids all warranties.

Bob, I installed the fan in conjunction with installing the EBS bias mod. I knew the amp would run hotter after the mod.

5660. RE: [acom-list] "External" fan install question (2000A)

Yahoo group: acom-list (2010 — 2016)
Date: 2013-11-07 12:30:43 UTC
From: Bob Naumann
Topic: 5640 Message: 5660

From what I've seen, there are at least 3 different variants of how the external fan is implemented in the 2000A.

Mine is one of the oldest 2000A models, and mine only comes on when it's too hot.

Others run all the time.

There are apparently some that have two installation options that offer either option – full time, or switched.

Perhaps LZ1VB could provide some details on these variants.

Thanks for posting this Hal, because that's what I see with a newly installed 24vDC fan on my early 2000A. I may end up swapping it out for a quiet 120vAC fan which should be powered continuously if the documentation is correct.

Hi all,

I installed myself a 24v fan on my early 2000A, back in 2005 or 2006 I guess. Installation was easy and it turns on when temp raises over 85C if I am not wrong. Which only happens during contest or digital modes.

Hi Martin,

You've been sending this sort of message for a number of years, and I want to tell you I really appreciate it. I *try* to be diligent with all of my electronic equipment with respect to heat. I do forget the filter on the amp occasionally. Your posts remind me to do it.

A few days ago my ACOM-1000 was idling around 40-42°C. I got the vacuum out and cleaned the filter. It now idles between 34-36°C. This is consistent with previous times I cleaned the filter. I don't know how much ~5°C affects the tube life, but I'm sure it helps to keep it as cool as possible.

I intended to post this several times in the past few years, but kept forgetting. I want to let you know that at least one member of the group appreciates your reminders!

Topic: 5669 Message: 5669

My 1011 was working flawlessly until a couple of weeks ago. Even though OPER LED is on after 30 seconds, I normally let it warm up for at least 1 minute or longer. I typically drive it with 30 - 40 Watts for 400W output.

A few weeks ago I noticed that amp went into protection with (yellow) IP LED and (red) F LED flashing at turn at a speed of about 4 Hz and (green) OPER LED is off for a couple of seconds. After that, the amp used to work normal. When I let it warm up for a longer time, in most cases it was working OK directly. Since a few days, it always goes into protection mode as described above.

I've send an email to Acom, hopefully they have an answer. Anybody has an idea what can be the problem?

Kind regards / 73

Pleun (PA3HHO)

Hmmm... LEDs are blinking at about 8Hz speed (not that that matters I reckon). I found that sometimes, the amp seems to work but there's no amplifier gain; TX LED comes on but I DON'T hear the relay from the amp switching and only see (obviously) the input power (around 30W) on the external output meter (after amp). When the relay switches, it goes into protecion. Maybe a relay issue?

Hi Jan,

You didn't lose all the magic smoke from inside your ACOM did you?
That's what all electronic equipment runs on. Magic smoke. If it
escapes, the gear won't work:

5675. Acom 1000 failure resolution

Yahoo group: acom-list (2010 — 2016)
Date: 2013-11-18 05:45:28 UTC
From: Larry Benko
Topic: 5675 Message: 5675

My Acom 1000 faulted with a hard PN07 fault code recently. This is a high voltage failure. Dis-assembly of the amp showed fuse F2 (in the soft start circuit) was blown, one diode in the high voltage rectifier bridge was shorted, and the plate current resistor pair R1A and R1B were blown open. Also there was short in the main transformer from the 1-4 winding (half the AC primary) to the high voltage winding. The transformer was removed from the amp and the transformer short remained so it was real. Attempts to blow the short open were un-successful so I needed a new transformer.

A new expensive transformer was ordered and during the wait time for the transformer (about 4 weeks) I checked every board in the amp. I especially looked at the electrolytic capacitors (since the amp was 10 years old) and checked them in circuit with a ESR meter. Two capacitors with excessive ESR were found on the main pcb and capacitor C5 (3300uF, 25V) on the main pcb was visibly bulging. These 3 capacitors were replaced. Upon recieving the new transformer and installing it in the amp all appeared OK. The amp warmed up fine but when the amp was put on line (without being keyed) it faulted with a PR06 error showing both plate and grid current.

The amp was dis-assembled once again and re-checked. This time a control grid to screen grid 4 ohm short was found in the tube between pins 1 and 5. Not having a new tube I removed the tube. I then very carefully ramped up a DC voltage from a power supply connected across pins 1 and 5. When the current reached 27mA the short disappeared. Wow! I then hi-potted from pins 1 to 5 ramping up to 1000V with current less than 1uA. Feeling that there was nothing to lose, the old tube was installed in the amp and the amp powered up fine and now works great again. I can only assume that in the troubleshooting process I turned the amp over a few times and some small particle in the tube must have become lodged between the 2 grids.

Just thought I would mention the conclusion of the saga.

Congratulations on resolving this issue. Sounds like a long journey.
It's somewhat concerning that the elaborate safety systems in the amp didn't prevent massive damage resulting from what undoubtedly was a tube issue. My thought would be to replace the tube in any case.

Hi Larry,

Do you have any comparisons of full plate current and screen current after repair compared to the original tube. Possibly part of the screen was incinerated? How that would possibly effect linearity, output and dissipation is an open question.

However, these NOS tubes generally lack quality control. Even if part of the screen was zapped, it may be no worse than the variation between tubes. I saw a 300 watt variation in max output power on 6M with three "tested" NOS tubes.

John,

I really do not think the cause was a tube issue. The initial fault was a transformer failure in the insulation resulting in a failure between on of the AC primaries and the high voltage winding. This failure accounts for the damage to fuse F2, the HV diode, and the plate current resistor. The tube issue I think was not related to the original failure.

Brian,

The plate and screen currents do NOT appear to have changed. I doubt the 27mA current did much damage to the grids. Had the short required an amp to clear I definitely would have thought differently.

I did a 2 tone test on 20m and saw no difference on the spectrum analyzer from measurements I had made several years ago. I have made several QSOs and asked for signal reports with no negative results. However I do have another tube on order.

Try Ron at Vinecom UK (do a google search)...As Acom dealer they sell NOS tubes and ship them tested. Look on his webpage for his tube tester (great!). 73

Please note that about 3 years ago, these tests were that the tube put
out 400 watts-- the limit in his country. Some of the tubes received
put out 700 watts max in an ACOM 1000.

The testing may have changed since.

Ron did everything he could to get me a tube with full 1 KW output. He
even went through the process of testing the NOS tubes in an ACOM1000
instead of the usual test jig. That testing was a bit of a pain. Those
who have changed tubes in an ACOM1000 know it isn't simply pull out the
old and plug in the new. You have to disassemble part of the plate
circuit and take care not to damage the temperature sensors.

I got one from Ebay from a seller called :

tubes-shop

No problems at all, the valve worked perfectly and was in its original sealed bag together with the small data sheet.

As it turned out my problem was not in fact the valve,however Ive now got the old one as a replacement.

Definitely check all 10 ohm 10w resistors on the HV board, Acom in Bulgaria helped me with one of these recently and it was just a 10ohm resistor open circuit.

Acom also sent this info below.. The guys at Acom are extremely helpful...Hopefully its a simple one, mine was.

Cheers VK3CM

Do you hear relays clicks after the countdown end?

If yes, you may start with checking F2 and F3 fuses on the Mains control board.

If not, check the 24V power supply voltages on JP3:10 and JP3:14 of the Interface board.

Check the relay driving voltages on JP4:15, JP4:16, JP4:18.

If a voltage is missing, follow the circuit.

A failure is possible in the HV transformer and HV rectifier too, as well as the metering.

If you have a HV probe, you can check if the HV is really missing, or it's there, but the problem is in the metering.

Hi Barry, I found some other notes for you
cheers
Brenton
VK3CM

1. Check whether a relay click can be heard at the end of 150s warmup period - just before the protection trip. If not heard. This should be the relays K2 and K3 on MAINS PCB which should apply mains power to the HV transformer primary winding at that time.

If this relay click is not heard the problem is in the relay control wiring or in the relay itself. Check also the top-cover sensing micro switch - it is in series with the windings of these relays.

2. Check the step-start fuses F2 and F3 on MAINS PCB (2A slow blow type). Check also whether the fuse holder spring contacts are tight - the fuse should not "rattle" in the holder.

3. Check the resistors R3 and R4 on MAINS PCB (10 Ohm wire wound).

4. Check the resistors R14 and R17 on HV PCB (10 Ohm wire wound). In the newer models these are labelled R14F and R17F and located on the top PCB - see the attached pictures.

5. Check the resistors R10, R11, and R12 on HV Filter PCB (1Meg Ohm 3W) - these are the HV-measurement resistors. In the newer units we have a single 3M flat ceramic resistor here - see the attached pictures.

6. Look over all 2.2nF/10kV (blue or yellow) disc ceramic capacitors for obvious break down marks like the ones shown in the attached pictures.

7. Using an oscilloscope check the following two voltages on INTERFACE PCB:

a) Check the +24VST on JP3:10. It should appear at the end of the 150s warmup period for at least 100ms. It is powered from the HV transformer and is an indication for successfully powered primary and not shorted any secondary.

b) Check the "hvm" signal on JP7:12. This is the HV-monitoring measurement signal. It should appear at the end of the 150s warmup period. It is normally 0.66V when only the RCU is active. It should become nearly zero (about 0.05V) during warmup and it should jump to about 1.7V at the end of warmup, when the relay click is heard - this corresponds to about 2800V plate dc voltage.

Hi Barry

I have forwarded privately a load of pictures and advices regarding your
Acom 2000 repair.
I hope it assists you.

Cheers
Brenton

Hi Barry, I found some other notes for you cheers
Brenton
VK3CM

1. Check whether a relay click can be heard at the end of 150s warmup period - just before the protection trip. If not heard. This should be the relays K2 and K3 on MAINS PCB which should apply mains power to the HV transformer primary winding at that time.

If this relay click is not heard the problem is in the relay control wiring or in the relay itself. Check also the top-cover sensing micro switch - it is in series with the windings of these relays.

2. Check the step-start fuses F2 and F3 on MAINS PCB (2A slow blow type). Check also whether the fuse holder spring contacts are tight - the fuse should not "rattle" in the holder.

3. Check the resistors R3 and R4 on MAINS PCB (10 Ohm wire wound).

4. Check the resistors R14 and R17 on HV PCB (10 Ohm wire wound). In the newer models these are labelled R14F and R17F and located on the top PCB - see the attached pictures.

5. Check the resistors R10, R11, and R12 on HV Filter PCB (1Meg Ohm 3W) - these are the HV-measurement resistors. In the newer units we have a single 3M flat ceramic resistor here - see the attached pictures.

6. Look over all 2.2nF/10kV (blue or yellow) disc ceramic capacitors for obvious break down marks like the ones shown in the attached pictures.

7. Using an oscilloscope check the following two voltages on INTERFACE PCB:

a) Check the +24VST on JP3:10. It should appear at the end of the 150s warmup period for at least 100ms. It is powered from the HV transformer and is an indication for successfully powered primary and not shorted any secondary.

b) Check the "hvm" signal on JP7:12. This is the HV-monitoring measurement signal. It should appear at the end of the 150s warmup period. It is normally 0.66V when only the RCU is active. It should become nearly zero (about 0.05V) during warmup and it should jump to about 1.7V at the end of warmup, when the relay click is heard - this corresponds to about 2800V plate dc voltage.

On Wed, Nov 20, 2013 at 9:48 AM, Brenton Meadows <brenton@... mailto:brenton@...> wrote:

one of these recently and it was just a 10ohm resistor open circuit.

Acom also sent this info below.. The guys at Acom are extremely helpful...Hopefully its a simple one, mine was.

Cheers VK3CM

Do you hear relays clicks after the countdown end?

If yes, you may start with checking F2 and F3 fuses on the Mains control board.

If not, check the 24V power supply voltages on JP3:10 and JP3:14 of the Interface board.

Check the relay driving voltages on JP4:15, JP4:16, JP4:18.

If a voltage is missing, follow the circuit.

A failure is possible in the HV transformer and HV rectifier too, as well as the metering.

If you have a HV probe, you can check if the HV is really missing, or it's there, but the problem is in the metering.

Thanks again Brenton - it was one of those fuses on the Mains control board
- replaced it and amp powers up fine!

5691. ACOM Director 0.7.1 Now Available - Logger32 Support

Yahoo group: acom-list (2010 — 2016)
Date: 2013-11-23 14:12:37 UTC
From: <yomengineering@...>
Topic: 5691 Message: 5691

(My email didn't seem to show up, so i'm posting this again through the website just in case)

Hi All,

I thought I'd just let you all know that ACOM Director 0.7.1 beta is now available for download from the following URL

https://acomdirector.codeplex.com/releases/view/115296
https://acomdirector.codeplex.com/releases/view/115296

There are a couple of small User Interface tweaks, however the main change is the addition of Logger32 support to allow the ACOM 2000A to automatically track the frequency of your radio when connected through Logger32.

Please note that this is very much a beta release and there may well be bugs.

Also, A big thanks to Val LZ1VB for doing the early testing on this new feature.

73 James M0YOM

• RF output: 1500-2000 W keyed carrier or SSB -. Constant carrier modes 1500W RF output -

• Frequency coverage: All amateur bands 1.8-28 MHz.

• Bandchange / Tuneup: Initial output matching process in less than 3 secs (typically 0.5 secs). Preset matching process / bandchange takes less than 0.2 second to move to different segment, same band and less than 1 sec for QSY to different band.

• Tuning memories: Non-volatile for up to 10 antennas per frequency segment.

• Drive power: Typically 50W for 1500W output.

• Input impedance: 50 ohms nominal. VSWR <1.5:1.

• Output tolerance: Up to 3:1 VSWR (2:1 on 160m) at full rated output before SWR protection circuit actuates. Higher SWR's tolerated at lower output.

• Harmonics: At least 50 dB below peak output at 1500W.

• Intermodulation: At least 35 dB below peak output at 1500W.

• T/R and keying: Vacuum Relay: QSK capable.

• Tubes and circuit: 4CX800A/GU74b tetrodes (2); resistive grid, PI-L output with RF negative feedback. Regulated screen grid voltage.

• ALC: Negative going, grid derived, -11v max, rear panel adjustable.

• Metering: Comprehensive. Remote Control Unit provides flexible monitoring of all amplifier operating parameters.

• Protection: Grid and screen current limiting, power inrush (soft-start provided), trip to excessive reflected power, RF arcs, password access protection if needed, correct T/R sequencing, tube exhaust overheat, cover interlock and HV crowbar.

Very rare Offering. I have only had one other for sale secondhand in the last 3 years and it was snapped up by a VK3 in minutes of knowing about its availability last month. These amplifiers are not cheap, but they are the quietest and most effective amplifier on the market.

New price right now is $8999 and worth every cent. When you have a play with an Acom Amplifier, you will want to own one, no question. It is an investment for life and the unit I have here is in great condition, any test is welcomed as a chance to show off what an Acom 2000A can do is just simply a lot of fun. Into our Palstar DL2K dummy load,this unit is exceeding 2000w easily and when you change bands, just key your microphone and the amplifier will change bands and be ready for use anywhere between 0-30mhz, and whisper quiet operation. An on air test of this amplifier is available, call me to arrange anytime.
This amp secondhand is very rare and will be offered on other international bidding sites due to its popularity.(one sold for $5900 USD in the USA on a popular bidding site 3 months ago and due to being in the USA, shipping would have been an extra few dollars as well.) I am open to reasonable offers before the end of any other process so call me to discuss if you are chasing an Acom 2000A, you will not regret the purchase.

5694. Antenna Relay Error

Yahoo group: acom-list (2010 — 2016)
Date: 2013-11-26 16:31:52 UTC
From: Bruce McLain
Topic: 5694 Message: 5694

Does anyone have any instructions on how to troubleshoot the "Antenna relay closed: it should be open" error message on a 2000a?

Bruce McLain - K5WBM

5695. Re: [acom-list] Antenna Relay Error

Yahoo group: acom-list (2010 — 2016)
Date: 2013-11-26 16:45:22 UTC
From: Barry N1EU
Topic: 5694 Message: 5695

Here are the instructions Bruce. I am also uploading this to the Yahoo Groups site under "troubleshooting instructions" folder.

73,
Barry N1EU

Preliminary Checks:

1. Have you found both 82 Ohm/0.5W resistors installed or not? They should be soldered just next to the relay coil leads.

2. Please make the following test. If the relay has sticked to TX, you should not be able to receive nor transmit through the amplifier's RF-bypass path, when it is powered OFF from the main power switch (on the front panel). If however this happens only when you turn the amplifier ON, the problem could be in the coil control or the contact monitoring circuits.

3. Please look over the RF-deck wiring. Note especially the air gap between the plates of both variable capacitors. Any alien subject (piece of wire or drop of solder) could cause arc faults or imitation of relay-contact closure. The same results if any RF wire does touching the chassis occasionally.

If Preliminary Checks okay, continue:

If the amplifier switches off with "Antenna Relay Closed - it should be open" a few seconds after a turn ON, and the relay is not stuck (you can receive through it) at the same time, it is possible that the contact-monitoring circuit but not the relay has failed. You should make the following tests before replacing the relay:

1. A 3-4 Ohm resistance from the "RF INPUT" coaxial connector (rear panel), to the chassis must exist when the amplifier is off (not powered). This circuit closes through the reception contact of the relay. If no connection, maybe the relay has latched to transmit position: you should replace it.

2. A normal receive/transmit operation with a transceiver must exist through the amplifier's RF "bypass" path when the amplifier is not powered at all (the front panel main switch in OFF). If no reception, the relay has latched to TX: you should replace it.

3. While receiving through amplifier's RF bypass, turn ON the main switch on the front panel. If the reception breaks at that moment, it means that the relay is OK but it's control is bad, i.e. the control actuates the relay parasitically, without a TX request on the KEY-IN:

do not replace the relay, I will give you another instruction.

4. If all above tests are OK, maybe the contact monitoring circuit has faulted. Remove the front panel but put on the top cover. Connect a dummy load or an antenna to the output.

a) Disconnect the connector JP1 on the WATTMETER PCB and turn ON the amplifier. If the amplifier would trip again with the same message "Antenna Relay Closed: it should be open", the problem would be in the monitoring circuit. Do not replace the relay in this case. I'll give you another instruction.

b) In the above conditions (JP1 still disconnected), if the amplifier does not trip with the old message, wait the warm-up period to expire and turn to OPER. Then close the KEY-IN input to the chassis: the amplifier must immediately trip with the opposite protection message: "Antenna Relay Open: it should be closed". If this would happen, the contact monitoring circuit is OK. I would give you more instructions in this case.

5. Switch OFF and connect JP1 to the Wattmeter PCB. Then turn ON and check the following voltages, measured with a DVM in respect to the chassis:

a) The DC voltage on either relay-coil pin to the chassis must be about +50V with only the RCU powered and during RX. The voltage between the pins must be practically zero (below 0.1V) at this time. If the difference between pins is too high, the problem is in the coil control circuits: do not replace the relay, I will give you another instruction.

b) The contact monitoring voltage (*ORC) on the Wattmeter connector JP1:5 must be about +1.8V (1.65...2V) with only the RCU powered and during RX (it is normally about 20mV during TX). If the voltage is low, do not replace the relay.

c) On the Interface PCB, check the ORC signal on JP7:38. It must be below +0.2V (0.12V typically) during the warm-up period and during RX (it is normally above +4.5V during TX. If the voltage is high, do not replace the relay.

please see if a late modification has been added to your amplifier. It concerns adding a diode 1N4148 to the INTERFACE PCB as shown on the attached picture "Ints_Diode.jpg" (note both violet arrows). This diode has been introduced about 10 months ago in order to improve the Arc-Fault detection system. If no diode is present on your PCB, please add it.

A general-purpose diode similar to 1N4148 will do (minimum requirements are 20V/20mA). Connect the diode cathode to the left-hand lead of R6 (located to the right of JP6 center), as shown on the picture. Connect the diode anode to the bottom lead of R131

(located about one inch to the left of the right-hand PCB edge, at a
middle horizontal level).

I'm using the Acom 2000a and Station Master + Acom director.

My Acom 2000a is connected to the CIV port of the Station Master.
The Microham Station Master sends data to the Acom that is set for Icom CAT and the amp follows bands and segment changes.

Next I have the Acom also connected on the back with his serial port to the computers serial port number 1.
Acom Director runs on that port and commands or read out is provided trough the com port.

Works just fine.

Just tested the new v0.71 beta version. If I activate the box to let Acom Director read logger32, I don't need the Station Master link no longer. Now the amp follows the bands and freq provided by logger32.

From: K2LS
Topic: 5704 Message: 5704

The other day I went out of the shack and when I returned my 2000A had shutdown and said "Antenna relay closed".

I restarted it a number of times and each time with about 30 seconds to go it said "No Bias", and shutdown.

I turned off the master mains switch and restarted it with no problem.

It has been on and off many times and works flawlessly.

Has anyone else seen this?

Thanks

From: <f8dql@...>
Topic: 5705 Message: 5705

Hello,
I am planning to automatize my Acom 1000 amplifier by replacing the 3 knobs by 3 stepper motors.
My concern is that the band switch is to tough to turn with a stepper motor. Instead of modifying the original band switch that I want to keep in case of rollback, I would like to install another one which will be modified to be easily controlled by a stepper motor.
I have asked Acom and they bill a such switch more than 200 € !
Do you know the brand and model of the original switch, or a reference for a compatible one ?

5706. Screen Backlighting

Yahoo group: acom-list (2010 — 2016)
Date: 2013-12-13 18:23:50 UTC
From: <wes@...>
Topic: 5706 Message: 5706

Hi, Just acquired an ACOM1000 and would appreciate some advice. The amplifier appears to work OK in that I get the expected power out for low power drive input however, the screen is very dark. Following section 5 on page 16 of the manual, after adjustment (see 5-1) the brightness stays at the level set for 20 seconds then goes dark again. I note that to read the auto-protect signatures (see 5-3) the screen is supposed to light up after pressing the OPER button and it does, then goes dark when OPER is pressed again.

Can someone please advise how I get the screen to stay bright?

Also, I see a number of stored auto-protection signatures stored. Is there some way to delete these? I don't see anything in the manual.

Thanks in advance.

Wes GW3RIH.

Wes,

My Acom 1000 does not work that way. Holding down the Prev and Next buttons for 3 seconds with the amp on line brings up the LCD menu where you can set contrast and the backlight intensity. Since you are saying the problem is the backlight you need to check out the control PCB. The lower right corner of page 6 of 25 of the schematic shows the microcontroller driving Q7 (FZT749) with a pulse width modulated signal to set the level of the LCD backlight. Does this driving signal go high (backlight off) after 20 sec. or does Q7 no longer work properly? If the signal BLT is correct then the problem is most likely on the LCD itself. I haven't looked at the LCD display closely in a while and don't remember if the backlight is part of the display or not.

Hi Larry,

Thanks for your response. Well, I just followed the manual as I described but then, thought to go on-line after setting the contrast and back-light levels and BINGO, the screen came on and stayed at the levels set! For sure the manual doesn't say to do that but, there it is.

I appreciate your taking the time to respond Larry.

5709. Low Bias message

Yahoo group: acom-list (2010 — 2016)
Date: 2013-12-15 03:28:41 UTC
From: <giw@...>
Topic: 5709 Message: 5709

Without any warning, and from a cold start, my 4 year old Acom 2000 ran the timer out and tried to start but had a hard shutdown with a low bias message. I waited 15 seconds and turned it on again, it timed out and did the same thing. I waited 5 seconds and for a 3rd time turned it on. This time it went all the way through start up and ran 1300 watts for over 12 hours of use during the 10 meter contest with no problems.

Anyone have any thought about what might be going on. Thanks for your help. Van W4GIW

5710. SB26 message

Hi

I have an Acom 1000 and have found messages about the Autoprotection
SB26 problem at startup,
but never found any info about how it was fixed.
Had it for a long time with about 90 seconds left of warmup time and it
always started up the amplifier on the second try
but not anymore!
The faulty code is this:
7ASB26 000000 000006 7BA294 0720DC D77FE3
Has anyone else had this SB26 problem with this code and have some info
of what could be the problem?

Goran,

Acom has provided 2 Excel spreadsheets (Acom 1000 Sig.xls and VoltageA1K.xls) that explain the error codes. Your error code is a plate current error of 30mA which occurred during standby or warmup when the tube was biased off but was measured at 30mA per the error code string you sent.

The spreadsheets were sent to me directly from Acom a while back and _not_ marked as do not copy. Contact me directly if you want the spreadsheets.

Hi Jan
I had sent an email to Acom but the email address listed on their website
gave no response.
The one you gave me gave a fast reply and it seems to be the tube that
has to be replaced.
Asking for prices of a new tube now from a couple of sources.
Ebay is of course a choice also but in what condition are these tubes?

Thanks for the email address.

Goran,

Don't write of the tube so quickly. The 30mA current that is flowing is not that high. The tube might be slightly gassy and can be brought back to good condition. There are several websites of people who have build test setups to "getter" the tube. Search for "GU-74b gettering". The test setup consists of an adjustable AC voltage source for the filament and a small fan to keep the tube seals cool. Let the tube cook for a day or 2.

Subject: [acom-list] RE: Acom 1011 problem (IP & F LED flashing)

Hmmm... LEDs are blinking at about 8Hz speed (not that that matters I reckon). I found that sometimes, the amp seems to work but there's no amplifier gain; TX LED comes on but I DON'T hear the relay from the amp switching and only see (obviously) the input power (around 30W) on the external output meter (after amp). When the relay switches, it goes into protecion. Maybe a relay issue?

---In acom-list@yahoogroups.com, <pa3hho@...> wrote:

My 1011 was working flawlessly until a couple of weeks ago. Even though OPER LED is on after 30 seconds, I normally let it warm up for at least 1 minute or longer. I typically drive it with 30 - 40 Watts for 400W output.
A few weeks ago I noticed that amp went into protection with (yellow) IP LED and (red) F LED flashing at turn at a speed of about 4 Hz and (green) OPER LED is off for a couple of seconds. After that, the amp used to work normal. When I let it warm up for a longer time, in most cases it was working OK directly. Since a few days, it always goes into protection mode as described above.
I've send an email to Acom, hopefully they have an answer. Anybody has an idea what can be the problem?
Kind regards / 73

Kees,
Just fixed one that had that same plate current error, when keyed but no RF applied.
One of the tubes was bad. Replace the bad tube and readjust the idle current was the fix.
Make sure you have the RF spike modification in your amp as well. It is free from ACOM or your dealer.

5717. First SB26 then PN07

Yahoo group: acom-list (2010 — 2016)
Date: 2013-12-31 15:27:13 UTC
From: Goran SM4DHF
Topic: 5717 Message: 5717

Hi

I have in an earlier post written about the Autoprotection SB26 message
and a fauly coude that inicated 30mA plate current in standby on an Acom
1000.
I have now a friend of mine with the same SB26 and the same faulty code.

Acom suggested to change the tube.
My friend did this a couple of days ago and I changed my tube today and
we get the same new problem.
The amplifier switches off at once indicating PN07.

PN0 is tests made during Power-On procedure, before HV is ON
Protection suffix 7 = hvm high voltage measure

Two amplifiers 30 miles apart with the same problems...

Please any suggestions

thanks
Goran SM4DHF

Goran,

The previous 2 .xls files I sent you have all the info on the fault.
There is something wrong on the hvm analog input to the microprocessor.
The voltage on hvm which is pin4 of JP3 should be 0v before the amp is
turned on. Then it should rise to ~1.76VDC with the HV on. The HV is
divided down via the 3meg resistor and a bunch of other parts as shown
on the schematic. If you really have a hvm failure BEFORE the relays K1
and K2 engage the AC to the HV transformer then the problem should be
super easy to figure out.

From: Goran SM4DHF
Topic: 5717 Message: 5719

Hi

My Acom 1000 is operational again.
The PN07 was the 2A Fuse F3 on Mains board that was not making good
contact in the holder!
When that was fixed amplifier turned off with 90 seconds left of warm-up
with the SB26 message
which was the problem from the beginning.
With old tube in place measurements now showed 0V on MAINS JP4:1.
Removed the connector on JP4 and
we had voltage on JP4:1
So it must be a short in the tube.
Changed to the new tube and it now worked fine and the BIAS
potentiometers were adjusted and the amplifier
is back in business.
Had some help of a friend with this who had a nice clean work bench,
logical thinking and bright eays to read
the schematics and the small print on the circuit boards!

Hi, thanks for reading.
My trust Acom 1000 reported an error "auto protection fault PN0B"
Manual says it's the output relay which is closed.

Anyone had this problem before?
Is this a DIY repair?

Just one week before FT5ZM, damn.....

Frank, ON7RU

Hello Frank,

I experienced the same problem after receiving a brand new Acom 1000 two months ago. It could be something else of course depending on other error codes you are seeing, but most likely it is a T/R relay failure. I called Acom on the phone and I was asked to run a test to verify the failure by briefly grounding the "Key IN" jack to ground on the back of the amplifier and listening for the relay "clicking" sound. If that still does not key the amplifier then you most likely have a problem with the T/R relay. Either the T/R relay coil is open or the contacts are stuck closed as it was in my case. If your Acom is still under warranty you could just return it for repair or on the other hand you can do it yourself if you are skilled with at working in very tight places. Assuming you have ordered a replacement TR relay from Acom, first you have to take off the top cover and then remove an internal shield plate inside the amplifier to get access to the relay. You will notice three wires soldered to one side of the relay and these have to be very carefully disconnected. The heavier wires on the RF contact side of the relay also need to be disconnected. The next step involves using a special tool needed to remove the recessed nut and washer holding the relay to the chassis. If you don't have one of these special wrenches then removing it can be very difficult and possibly result in damage to the relay or surrounding parts. After going this far in attempting the repair the amplifier myself I decided, after not wanting to damage anything and void my warranty, to send the amplifier back to Array Solutions in Texas, our U.S. Acom distributor. They repaired it and returned it in a few days. So far, no more problems. Good luck and hope you get it back on the air soon. Its a great amplifier.

Hi Bob,

Thanks for the quick reply.
Just performed the procedure to check the relay and I don't hear a thing.
So I suppose it's the TR relay.
Have the amp for more then 5 years (and it gave me a lot of new bandpoints), so will send a mail to ACOM and ask for the next steps.

Thanks again Bob, and enjoy the rest of the weekend

Glad to help out Frank. I believe Acom changed over to a new manufacturer for the TR relay, which is what I have now in my amplifier. Good luck and I hope you get back in the DX piles ups soon. Like you I am waiting for the FT5 DXpedition to go QRV. I need them myself. hi hi.

5725. Acom 2000A Fails to Start-up

Yahoo group: acom-list (2010 — 2016)
Date: 2014-01-19 13:48:30 UTC
From: Terry Burbidge
Topic: 5725 Message: 5725

My Acom 2000A failing to start:

* Power LED on Amp front illuminated
* My callsign appears on RCU when amp switched on
* Depress start button
* RCU begins start-up routine (LEDs illuminate, hear relay operate (click) in amp, RCU attempts to start up; 'TEST' cw message normally ends on the 'T' and..
* Amp and RCU shut down and return to displaying my callsign on RCU

Actions so far:

* Tried a separate mains ring circuit

* Checked mains plug wiring - ok

* Checked for continuity and shorts on pins from RCU to DB9 plug - ok

* Removed back panel of RCU and (carefully) cleaned pins and re-seated plug

Any ideas please?

Cheers,

Terry/G4MKP

Hello,

RS232 of Acom 2000a is connected to my computer. Talks with Acom Director 0.70.
CAT OUT from Station Master runs to CAT on back of the remote control unit.
Check to use two 510 Ohm resistors.
KEY IN on the back of the RCU is connected to PTT PA of the Micro keyer II
From the RCU the supplied cable runs to the main unit connection the remote controller and KEY IN/OUT.

Mark,

This is an easy problem. Something (like the Signalink) is delaying the key line to the amp enough that the amp is being hot keyed. I have an Acom 1000 and it will fault if the RF is present when the amp is keyed. This is a good feature and it protects the amp's QSK relays. This is super easy to verify with a dual trace scope. You have one of these, correct??? This is one of the easiest problems to figure out. Just look at a sample of the RF into the amp and the key line into the amp.

Without a scope you are just guessing. I have made a bunch of these types of measurements at http://www.w0qe.com/amplifier_timing.html and your 756 delays the RF about 9ms after the key line.

Interesting. Guess they're expecting high volume sales with HRO at those prices. John is right though, used market is thin and value may drop a little but tanking may be an over statement. Bought my 1000 for less than that with a spare tube and have no plans to sell anyway. Carl

Wow -

$1500 off the last price $7995 which increased after ten years!

I remember looking at $7000, then up to $8000 after the new RCU came out.

Now back to $6500.

Wonder if that due to the OM amps being type accepted recently ?

The comparable OM amp is $8000. The comparable Alpha amp is $8500. So the new Acom pricing seems to be very aggressive.

No - that's not the case with Acom.

They told us that they feel that because of the prices that their amplifiers have been selling at, that they do not sell enough. So, they have cut the prices on all models.

There's more on our web page.

I love my ACOM, best AMP I ever owned, used them ALL. ?They do not compare with Alphas, at home and my DX location for contesting they cannot be beat. ?Like the Energzier Bunny--"THEY KEEP GOING AND GOING", and going…..?

No - that's not the case with Acom.

They told us that they feel that because of the prices that their amplifiers have been selling at, that they do not sell enough. So, they have cut the prices on all models.

There's more on our web page.

My new ACOM 1000 came two days ago from HRO without the plug or extra packing. A quick trip to Lowe's for a $9 plug and I was all set. The amplifier was shipped in double boxes without any additional packing in between. The package appeared to be the same that HRO received. The box as it was marked 25 of 39 for the Virginia store location.

This was posted via this reflector a few days ago from Array.

That was real shady and dirty how Acom corp went to HRO and never consulted Array or gave them a heads up.

I wonder what back room deal was made there, talk about back stabbing a partner.

I'll deal with Array any time. They don't just sell products they offer valuable advice and support other outlets cannot.

My $.0.02 -- Jay and Bob (at Array Solutions) have provided most excellent service and have displayed patience in resolving issues above and beyond that normally experienced. I am pleased to say that I am enjoying several products they supplied.

It is high time the amateur radio community recognized the threats to our equipment through double-dealing/shady deals on the part of many in the business. Any well-heeled proprietor of a large well-known Amateur Radio retail business who would shut down a manufacturer of a truly superior product that clearly bested anything being sold by that business is undeserving of our support, no matter what the breadth of his product list is, nor the amount he spends on advertising. That kind of dealing should be seen as an affront to all of amateur radio. Same with high volume retailers who can/will cut to the bottom line without providing technical service to support their sales.

Amateurs who are on the lookout for the lowest price for any product no matter what are surely killing our access to quality gear, driving reputable businesses to the brink of bankruptcy.

If ACOM amps can no longer be sold because of undercutting prices by No Service retailers, etc. then we all not only will lose an excellent product, but also we will become slaves to ultimate control of our operations by those bottom-feeders. When you have no choice, no option, for quality gear then you may as well go back to home brew bread-boarded QRP CW operations -- because only those with more money than sense will be able to operate well designed and top-notch stations. It's already happening to many.

Our modern business ethic is evidently get all you can and don't worry about the future -- engineer monopolies and control markets to the detriment of the consumer. Bottom line for the business and Top Line for the 'executives' is what business is all about in these modern times. That's what happens, I guess, when businesses become 'people.' They then display all the base qualities available to any person, with no controlling philosophy for maintaining 'the good.'

I'm glad I'm over the hill. It would surely kill me at an early age to see my beloved avocation destroyed! Vic, W4VIC

Amen Vic!

I can remember growing up in a small town and there was rumor of a large store coming that would offer a lot and make the town people more competitive all that happened is the small stores close their doors and main street died. The personal touch was gone and you were nothing but a number.

I have purchased several products from Array Solutions and will continue to go to them because of the support they provide no matter the difference in price.

I know of very few companies that will setup and test your equipment prior to it being shipped and add additional packing to ensure it arrives in one piece.

Especially in my case, I live in the Philippines and having something shipped half way around the world only to find out that it does work, no need to go further.

All I can say is Thank You Array Solutions for all that you provide!

Wow, I can’t say enough about the service Array Solutions provides. I shopped and studied prior to my Acom1000 purchase last year. Bob was excellent. He closed the deal with his patience and knowledge. I have the competitor store in my neighborhood. I can honestly say that for the most part they have little if any knowledge on the product line. Typically the center of competence is located on the East coast.
Am I happy about lighting a match to $700+… NO, but I decided the performance and quality justified the prior price. I will have this amp for a very long time.
The new reseller has a long learning curve to come close to Array.

Time will tell…

A much better move by ACOM would have been to appoint Array Solutions as the USA distributer/service center with HRO as a dealer. Array could also have been a dealer with the understanding that they not undercut HRO or any other US dealer. That way, Array would have been rewarded for their loyalty and risk in establishing the ACOM brand in the US and incentivizing them to continue their sales and service efforts. The end user price may have been a few dollars higher, but it would have ensured a better stock of products, parts and service facilities.

The folks at the ACOM factory in Bulgaria are great engineers and manufacturers and they produce an excellent product, but I suspect that operating in a country that was under Soviet domination for decades has left them with an impaired understanding of free market capitalism and how it works here in the US.

5756. 2000A RCU and K3 CAT

Yahoo group: acom-list (2010 — 2016)
Date: 2014-02-16 21:42:40 UTC
From: Hank Garretson
Topic: 5756 Message: 5756

Just got the new ACOM 2000A RCU. Hooked it up to my K3 and N1MM Logger using Figure 7-2 CAT Connection by RS-232 Y cable.

Also have the P3. Y cable is between K3 and P3. A RS-232 cable goes from P3 to computer.

K3 baud is set at 38,400.

RCU is set for CAT-K3.

It works with hiccups. 2000A follows K3 frequency. When I change band or band segment, I hear the 2000A stepped motors--just as expected and wanted.

BUT, with K3 sitting on a steady frequency, the ACOM hiccups. At random intervals (for example: 8 seconds, 8 s, 61 s, 10 s, 20 s, 15 s, 23 s, ...) I hear the 2000A stepped motors as if 2000A is changing frequency. RCU frequency segment indication momentarily changes to a different, random frequency segment and then goes back to the right segment.

Seems like a polling issue, but I don't have the foggiest.

Perhaps K3/P3 should be treated as a single unit, and I should put the Y cable between P3 and computer?

Help please. Suggestions?

73,

Hank, W6SX

Does anyone know if the new RCU unit supports remote power on and off? Or is the RP unit still required?

One would think they could have easily integrated the necessary chip to bridge the power control lines to the newer 15-pin multi use port on the newer style controller.

I moved the Y-cable to between the P3 and computer. Everything is now working perfectly. There is stuff going on between the K3 and P3. The computer cable out of the P3 looks like a K3 to both the computer and to the 2000A RCU.

Can someone comment on the way the old RCU for the 2000a memorizes custom tuning for SWR.

The manual for the new RCU states that it will memorize up to 10 custom tunings for each band segment. Can anyone out there confirm that the old RCU can do the same thing?

Thanks,

Charles K5UA

Bob,

I was given some paint from a supplier of Acom amps for my Acom 1000 face....the match was sort of ok but not great. I could spot the touch-up easily....someone mentioned this on a decorating forum...might be worth a look....

''Solution #2 - Behr's ColorSmart App

'' I'm glad you asked about this one, I'm a big fan of apps and have found that I can rely on my phone for just about anything these days. And right you are that there is an app for just this purpose. It's called ColorSmart by Behr and my colleague *PatInPaint*<http://community.homedepot.com/t5/user/viewprofilepage/user-id/30>actually did a write-up about this awhile back, ColorSmart by Behr App for iPhone.<http://community.homedepot.com/t5/What-s-New-in-our-Paint-Aisles/ColorSmart-by-Behr-App-for-iPhone/td-p/7695>
''

Cheers,

Terry/G4MKP

Go to a good hobby shop
-or-

WWW.testors.com http://WWW.testors.com
Brand: Testors
bottle number 4797
color name panzer schokladnbraunr 1/2 oz
UPC code 7561113012
price about $3.00 per bottle [1/2 oz]

The paint needs to mixed/shaken very well!!!!! to ensure even color
I used a tooth pick to apply the paint on the scratches. Two coats are
required [thin coats]
When dry it's darker than when wet so don't panic.
At arm's length it is almost invisible and a very close match to the
original color.

The paint color information I posted covers the 2000A front color and the RCU color. My 2000A chassis cover behind the the front panel is black.
My ACOM 2000A is 2001 vintage and the color from Testors works fine.
I find ACOM's color pallet very nice.

From: <mikestraining@...>
Topic: 5775 Message: 5775

I am a new ham and purchased my second hand ACOM 1000 about 6 months ago (Serial 100325)...
Over the past month I've had an intermittent PN27 Error code on warm up...Now it is no longer intermittent and will not warm up without this error...I have searched this group and see that the problem is HVM and could be the R13 resister (see the photo I uploaded).
Can any tell me how to troubleshoot for this error?
Is there a way to confirm that this resistor is the problem or should I just replace it?

Can anyone tell me where I can find a replacement for this resistor? (Part number, vendor, link, etc)
I love this AMP and when I opened the cabinet I was even more impressed with the quality of craftsmanship that went into this piece of equipment...
Thanks...

The HV measurement circuit is many times the culprit. Depending on your amp manufacture date it may be three 1M ohm resistors or one 3M ceramic film resistor. Either can fail. And it may be that they fail only under high voltage.

Check the little metal film resistor too that is the shunt to ground.

Just replace them and see what happens. If you need a 3M ohm ceramic we have them.

Thanks Jay,

Just to be safe, I will replace both resisters...Can you give me the resister number for the small metal film resister that is the shunt to ground? Is it R14A?

Thanks,
Michael-K0SS

Date: 2014-03-03 16:34:17 UTC
From: TM
Topic: 5780 Message: 5780

I own an ACOM 1000 Amp and yesterday, during the ARRL SSB Test, the Amp stopps working.
The Code in the Display shows Auto-Protection PN2B

The Error Codes are as follows

1APN2B 000000 000000 1B9E92 0560DE D76F80

2APN2B 000000 000000 2BA193 0560DE D76FBE

3APN2B 000000 000000 3BA199 0560DE D76FB4

4APN2B 000000 000000 4BA19A 0560DE D76FB7

5APN2B 000000 000000 5BA19A 0560DE D76FB7

6ATR6B 000000 000300 6BA79A 7720DE D77FD5

7ATR6B 010000 060300 7BA8AA 7720DE D77FED

Before I will give the Amp to the local Dealer, could anyone tell me, what the error

could be?
Perhaps a new tube?

As I recall from 14 or 15 years ago when I got mine and had the same thing happen, the LED may have just popped out of the holder during shipping.

Of course, there’s no harm in that and no hurry to correct it, so when you feel like it, unplug the power, take the cover off and just pop it back in place.

Rich,

The 2S1 does not directly integrate with K3s. It is designed specifically
for Yaesu radios.

Not to say that it won't work with K3s, but you will have to build an
interface for each K3 that converts the TX Inhibit signal from what the 2S1
provides to what the K3 needs.

5797. A2000: connect new RCU to A2000S

Yahoo group: acom-list (2010 — 2016)
Date: 2014-03-16 09:14:00 UTC
From: <lx1no@...>
Topic: 5797 Message: 5797

Hi,

I set-up a new A2000 and encountered a problem to connect the new RCU to the A2000S switch.

It used to work with the old A2000. Now, in order to connect to the new RCU, I had to add a male/male adapter to the old cable. But, it doesn't work. The RCU does not switch antennas. They are defined on the RCU and are shown correctly on the display when I switch bands. I didn't find anything within the parameters that indicates something has to be "switched on" first.

Any help?

I am big time pissed. I just bought a 2000A from AS 4 months ago and am now out $1450.
A truly clueless move on Acom's part. This is such a small market. Price cutting will not result in enough additional sales to make any real top line difference.
Not that many Acom owners sell their amps (still a great product), but we've all had our asset devalued about a thousand bucks.

i wonder if by adding a dealer...caused the lower profit margins,,,
hence the lower price ???

or how much, if any did the ACOM to dealer cost go down ?
versus ACOM setting the market to sell it for
less , with less profit ?? due to more dealer competition???,

bill who still loves his 2000...

Steve,

When you need service on your amp... guess who you have to send it to...?

Yes... Array Solutions....

ACOM did a real nasty thing.

I just got my amp back from Array Solutions..... Great service!

I think being sorry to see a lower price dictated by the manufacturer after we purchased at the former higher price is something we would all feel. No quarrel with those feelings if directed towards the manufacturer where the decision was made...not the former distributor.

As far as Array Solutions is concerned, I think Jay and Bob were elegant in deciding to continue to service Acom gear after the manufacturer slapped them in the face by handing the biz to HRO.. One should remember how Array solutions stepped in to remedy Acom service issues when Array first took on the distributorship. Acom garnered substantial goodwill from US hams during Array Solutions exclusive distributorship. I am most thankful that Array will continue to service Acom amps. My 2000A has run flawlessly for over 10 years whereas my 87as have about one failure every 2 years. When it comes time to add another amp you can bet I will look to Array Solutions as I do for all my antennas and accessories.

W1SRD, you are not alone. I bought an Acom 1500 last May and love it. Would I have liked to save $750 by buying today? Sure. But, bottom line, the price change will not affect how I feel about this amp or how it performs.

As to resale value, it appears my Acom 1011, which has given flawless service, has been discontinued. This, along with the lukewarm reviews on eHam leaves me with an amp that will be difficult to sell and for far less than the resale value before it was discontinued.

Acom was remiss in how they treated Array Solutions. To blindside your primary distributor, who is also your service center was a foolish move. Acom may sell a few more amps by adding HRO, but they may have been able to sell more by simply lowering the price.

The ability to speak with Bob, W5OV, at Array Solutions and have my questions answered is worth far more than talking to a salesman at another dealer. I'll continue to favor Array Solutions with my business when I need to make a purchase.

Just my two cents on the matter from an more European vision:

I was stunned by the fact that Acom came to market with the Acom 1011 in general. Tubes are very very hard to get here in Europe and a pair of matched tubes in comparison to one single GU74B tube with as end result a **less** rugged & **less** RF output striked me out completely. Fortunately Acom kept on producing the Acom 1010 at least for sale in our part of the world.
(Side note: If Acom would have considered for the Acom 1010 to add a vacuum relais and the 50MHz band option, they would have produced most likely their best selling amplifier ever. Despite email conversations with the factory unfortunately this design change did not make it to the market.)

Just like the Acom 1500, the Acom 1011 were clearly designed for the USA market. Solely on the availability of tubes alone, here in Europe we favour by far the Russian made tube tubes. Beside the availability, these tubes are darn cheap, extremely rugged, produces easily lots of RF Watt in a properly build amplifier etc. Not sure if the lack of availability of these Russian type tubes drove Acom to produce the Acom 1500 model with it current tube choice though... (disclaimer :-))
An Acom 1500 model based on a GU43B tube in example therefore kept on being a (wet) dream up to today.

With regards pricing: We see a price drop in Europe as well. Think about it like this: Not bad if you wanna buy a new amplifier in these economical difficult times! Does that lower the 'usability' value I give to a previously purchased amplifier? Hell no! Acom is and remains the VERY best builder of amplifiers one can buy these days and now available at even a lower price, simply superb! I hope Acom can sell even more units and survives the economic set back we all sufffer from.

Some thought for the mind: We cannot "afford" not to have Acom around in the HAM RF amplifier market!

5807. Acom 1000 PN27 Error cause from power company...

Yahoo group: acom-list (2010 — 2016)
Date: 2014-04-06 19:35:43 UTC
From: <mikestraining@...>
Topic: 5807 Message: 5807

I have an ACOM 1000 that errors out with PN27 within a second of warming up...(This indicates a the high voltage is either above 3300 volts or below 2000volts...)

This happens without fail every Saturday and Sunday morning from about 4:00am to 8:00am...(I do not have the exact times)...

I have verified that the Amp is set up for 240V. I have checked the incoming 240 Voltage and it's between 244-246V. I have take the advice of my very experienced HAM buddies and have asked Florida Power and Light to come out and install and datalogger onto my meter to see if we can measure anything that might be causing this consistent error on weekend mornings.

Prior to seeing this pattern I opened up the AMP and together with a very experienced HAM checked for a failed component....We found nothing and are both convinced that the AMP is fine...

This error happened again this weekend and I am anxious to see what the data logger shows tomorrow morning to see if we can see anything that might might be causing this...

Here's my question...Assuming that my incoming 240V is slightly higher in the early weekend mornings, and assuming that this slight increase in voltage is causing this error message, does anyone know (Jay maybe), if there is a way for me to adjust either the firmware or hardware slightly so that my AMP does not continue to trip like this on the weekends?

There must be a way to make an adjustment so that this nuisance alarm stops.

Any ideas?

Thanks!
73 K0SS

Dear OM,

According to Val from ACOM, amp can withstand up to 10% voltage fluctuations, that means it can withstand up to 240+24V, so you are in safe limit, please check for other issues may cause!

5809. PN07 Fault with Acom 1000

Yahoo group: acom-list (2010 — 2016)
Date: 2014-04-06 23:41:16 UTC
From: <N2Len@...>
Topic: 5809 Message: 5809

I am hoping you can offer some assistance with a PN07 fault that just happened on my Acom 1000 amplifier.
Symptoms....

1: Powered up Acom 1000
2: Both 10 Amp 250 Volt fuses blew
3: Internal 2 Amp 250 Volt F3 fuse blew
4: Replaced the 3 fuses. Amplifier powered up. Internal F3 fuse blew again, PN07 fault on display.
5: Quick inspection clearly shows the top of capacitor C5 (3300 25 volt) bulging.
Has anyone experienced a similar fault with the internal fuse F3 blowing?

Much appreciated..
Len N2LEN

That is, if the correct setting in the amp itself is selected for the mains!

Standard should be wired for 240 Volt, although I have one that was shipped with 220volt setting... On a 240v mains, this can cause the warning.

Easy to check inside the Acom amp, on the internal view of the top cover is the wiring diagram present.

Hello

I like to inform the group that I'm selling my Acom 2000a with new color RCU.
Purchased at Vine UK november 2012, waranty until nov. 2014 Tubes are almost new.
Not many hours on the clock. Non smoker, showroom condition.
comes with all boxes, manual and I do have a special made cable for Station Master by Microham and serial cable for Acom director remote controlling via internet or network.

Pse mail me off list for info or price.
I'm willing to ship but only with UPS + Insurance to have both parties secured and save.

73 Phil.

Yes, I have verified that it is set up for 240V... It's definitely being caused by my input voltage...I'm just not sure if the AMP is overly sensitive to a very some kind of transient increase in voltage that only happens on early Saturday and Early Sunday mornings and is causing the PN27 error...
It would be nice if there was an adjustment inside my amp to eliminate this problem...The AMP has plenty of headroom regarding voltage fluctuations...So all I would need is to somehow raise the alarm level a bit higher, assuming that it's my AMP being overly sensititve for some reason...

Yes, I have verified that it is set up for 240V...It's definitely being caused by my input voltage...I'm just not sure if the AMP is overly sensitive to a very some kind of transient increase in voltage that only happens on early Saturday and Early Sunday mornings and is causing the PN27 error...It would be nice if there was an adjustment inside my amp to eliminate this problem...The AMP has plenty of headroom regarding voltage fluctuations...So all I would need is to somehow raise the alarm level a bit higher, assuming that it's my AMP being overly sensititve for some reason...

Larry, Is this what you are referring to? If so, does anyone know how to safely adjust these "software derived protections"?

The PLATE CAPACITIVE DIVIDER and RF WATTMETER are the main sources of information for the control circuit of the amplifier during the antenna impedance matching process. The control circuit is based on the 80C552 micro-controller from Philips.
All voltages are delivered from the MAINS&LOW VOLTAGE and HIGH VOLTAGE SUPPLY PCBs. The control grid, screen grid and plate currents, plate cooling airflow temperature, reflected power etc. are permanently monitored. Many software-derived protections are based on this information.
* Detailed electrical schematic diagrams are available from ACOM or from your dealer on request.

No Michael
maybe it didn't come through on my email the manual says the following

”you might use the off center tuning hint also to compensate for mains voltage variations in order to maintain to efficiency: tuned to the right
when the mains is higher, or tune to the left if it's lower than the nominal voltage. Please see S.2-2 (line voltage selection) for more than 10% difference
from nominal."

You need more than a serial connection to the Acom - you need software support as well. Does WriteLog or DX4WIN directly support the Acom amp? The software I know of that supports Acom directly includes TRX-Mgr and DDUtil.

Thanks Callum,

To confirm, it is certainly possible to have the ACOM 2000 change frequency with the radio, although not through a direct connection from the CAT connection on the radio to the ACOM.

As Callum mentioned, my own software ACOM Director can do this if you are using Logger32 (I'm working on adding additional support for other packages).

As Barry N1EU points out there are at least a couple of other software packages that support this too.

If anyone is into developing your own software and wants to know how to do tell the ACOM 2000 to switch frequencies, drop me a line and I'll send you some info.

"I do not think it is possible to directly change bands with CAT control using the old Remote."

I have been doing this for quite some time - it works fine. I have a CI-V connection between the Acom and my station. I use TRX-Acom working with TRX-Manager software. It works perfectly.

5832. RE: [acom-list] 2000A/ N4PY software

Yahoo group: acom-list (2010 — 2016)
Date: 2014-04-18 13:57:20 UTC
From: AB2E Darrell
Topic: 5824 Message: 5832

Hi everyone,
I just confirmed via email with N4PY that his software lets the Acom track with the rig, and will interface at the same time with N1MM for contest logging. You can follow up with him any additional details. His website is www.n4py.com .
I have no interest in the company.
73 Darrell AB2E

"Hi Darrell,

Yes, my N4PY Icom program for your 756 ProIII will control the Acom 2000 through it's serial port and requires a USB to serial converter connection from a USB port on your computer to the DB9 on the Acom. These converters are available on the internet and cost between $10 and $40.

My software also can work at the same time with N1MM. And you can simply have my software running in the background. The interface between N4PY and N1MM is made with a pair of virtual serial ports. You make the virtual serial ports with VSPManager which is a simple free program. See below for the full instructions.

Yes, please announce this on the Acom reflector. I have had this interface for several years so I assume my support matches the original Acom interface.

Also, I do not have any support for the Yaesu FT1000D.

Third Party Logging Programs

There is a third party logging program interface. If you have a logging program such as N1MM that does not support the Tentec file interface, you can use this port in conjunction with VSP Manager's virtual comport driver to get the third party logging program to work with your radio and this program at the same time. First, you need to install the virtual comport driver. You can get it at www.n4py.com. It is on the "Previous Versions" page at the bottom.

Once this virtual comport driver is installed, it will give you a pair of comports to use. Use VSP Manager to define
these comport pairs. In your logging program, set it for one of these comports and select a radio type of Kenwood TS-570 (Kenwood TS-50 for HRD).
Set the other comport in the USR5 settings window for the Third Party Logging Comport. Also turn on the check box "Third Party Logging Comport".
After these changes are made, exit and restart the program. Your third party logging program should now see the N4PY Icom program as though it

was a Kenwood TS-570, regardless of the actual radio you are using.

Acom 2000 Amplifier

There are special Acom 2000 settings in the "Usr5 TrnsV, Steppir"
settings window. Here you will find an "Acom 2000 Comport" check
box and comport list box. If you are using the Acom 2000
Amplifier this is where you define the comport number for the
amplifier. The program will run the comport at 1200 baud and
send frequency information to the Acom 2000 amplifier. Connect the
serial cable to the Acom amplifier serial connection. The serial cable
must be a null modem cable and only use pins 2, 3, and 5. That is to
say that pin 2 on one end goes to pin 3 on the other and vice versa.
This will cause the Acom 2000 to follow the frequency of the radio
without the need to transmit to set the frequency. Once you have made
these changes to the program settings, exit and restart the program
for these changes to take full effect.

Now when you start the program, go to the "Call Sign, TopTen" settings
window. Here you will see a line that is labelled "Acom 2000".
There is a "Oper" button. Clicking this will cause the button to turn
red and set the amplifier in operate mode. Clicking it again will
cause the button to go back to black and put the amplifier back in
standby mode.

You make the virtual serial ports with VSPManager which is a simple free program. See below for the full instructions.

Yes, please announce this on the Acom reflector. I have had this interface for several years so I assume my support matches the original Acom interface.

Also, I do not have any support for the Yaesu FT1000D.

Third Party Logging Programs

There is a third party logging program interface. If you have a logging program such as N1MM that does not support the Tentec file interface, you can use this port in conjunction with VSP Manager's virtual comport driver to get the third party logging program to work with your radio and this program at the same time. First, you need to install the virtual comport driver. You can get it at www.n4py.com. It is on the "Previous Versions" page at the bottom.

Once this virtual comport driver is installed, it will give you a pair of comports to use. Use VSP Manager to define
these comport pairs. In your logging program, set it for one of these comports and select a radio type of Kenwood TS-570 (Kenwood TS-50 for HRD).
Set the other comport in the USR5 settings window for the Third Party Logging Comport. Also turn on the check box "Third Party Logging Comport".
After these changes are made, exit and restart the program. Your third party logging program should now see the N4PY Icom program as though it was a Kenwood TS-570, regardless of the actual radio you are using.

Acom 2000 Amplifier

There are special Acom 2000 settings in the "Usr5 TrnsV, Steppir" settings window. Here you will find an "Acom 2000 Comport" check box and comport list box. If you are using the Acom 2000 Amplifier this is where you define the comport number for the amplifier. The program will run the comport at 1200 baud and send frequency information to the Acom 2000 amplifier. Connect the serial cable to the Acom amplifier serial connection. The serial cable must be a null modem cable and only use pins 2, 3, and 5. That is to say that pin 2 on one end goes to pin 3 on the other and vice versa. This will cause the Acom 2000 to follow the frequency of the radio without the need to transmit to set the frequency. Once you have made these changes to the program settings, exit and restart the program for these changes to take full effect.

Now when you start the program, go to the "Call Sign, TopTen" settings window. Here you will see a line that is labelled "Acom 2000".
There is a "Oper" button. Clicking this will cause the button to turn red and set the amplifier in operate mode. Clicking it again will cause the button to go back to black and put the amplifier back in standby mode.

You need more than a serial connection to the Acom - you need software support as well. Does WriteLog or DX4WIN directly support the Acom amp? The software I know of that supports Acom directly includes TRX-Mgr and DDUtil.

From the Array Solutions Acom FAQ page:

http://www.arraysolutions.com/Products/Acomfaq.htm

Remote control software for the Acom 2000 ?

The Acom 2000A is capable of being used in a remote station. Acom does not offer nor support any third party software solutions.

The Acom RPON (Remote Power ON) optional module will enable you to remotely turn the amplifier on and off.

The following software packages claim to work with the Acom 2000A:

Name URL

TRX-Manager http://www.trx-manager.com/

DDUTIL http://k5fr.com/ddutilwiki/index.php?title=Latest_Revision

Acom Director www.m0yom.co.uk <http://www.m0yom.co.uk/>

Neither Acom nor Array Solutions supports these applications with the Acom 2000A, but we can tell you that users have reported that they have been successful in implementing them.

Hi all,

The only real remote option I know for Acom-2000A is the RC-1216H from the RemoteRig team;

http://www.remoterig.com/wp/?page_id=1010#tabs-2

If that small device you will get full remote use from your Acom-2000A using internet.
And you need no extra software since it is web access.

5838. ACOM 1000 PN2B Protection

Yahoo group: acom-list (2010 — 2016)
Date: 2014-04-22 07:21:01 UTC
From: <thorsten.meirich@...>
Topic: 5838 Message: 5838

Hi to all,
some weeks ago I had an ATR6 Error during the receiving period in a QSO.
After Switch Off/On the Amp does not start anymore. PN2B Auto Protection.
A few days later the Amp started without problems and work well for 2 weeks. Now the error is the same. I tested the amp and see, that there is a 3.5 Ohm Resistance between Ant Out and Chassis.
I looked behind the frot panel and switched off JP1 from the Wattmeter PCB. The Amp started well and after
warm-up period I switched to Operate and put the PTT to chassis. The Protection was HOT Switching. I put the JP1 Cable back and put the amp together. Now the PN2B Protection Error is here again.
At the moment I have the Amp in my cable chain and it works in bypass mode. When I switch the amp on, the ist no break in receiving.
Should I change the vacuum relay? Or is there manual, how to switch off the Relay Protection, that I can test it?
Regards
Thorsten DJ7ZZ

I consider myself lucky because I waited a few months before ordering my 1000 and got the benefit of the price reduction, which made my decision easier. One of the main reasons I moved from Alpha to ACOM was service. My past experiences with Array Solutions were very positive and Jay took time to answer all my questions before we got to the "sales" part. I like many others, would like to know what went on behind the scenes regarding ACOM's decision to bring HRO onboard and feel that they (ACOM) should have consulted with Array Solutions or at least gave them a "heads up" before the decision was made. I guess this is the reality of the business side and we will most likely never know the details. Having said that, ACOM still produces a very fine product line and their engineering/manufacturing is second to none.

Topic: 5824 Message: 5843

I know this topic went around and a few options were mentioned. I just wanted to let the group know the positive experience I just had using N4PY software to get the Acom 2000A to follow the radio automatically. This is really cool to see, it's totally seamless, and takes the operation of the Acom 2000A to a new level for me.

Setup: Icom 756 Pro III/Acom 2000A with old RCU.

The N4PY software does a fine job of rig control for the Icom (many other programs do too), and he has a long list of other rigs that he supports (although only newer Yaesu, and no FT-1000D which is my other radio for SO2R). Where it excels is the extra things it allows you to integrate. In my case, I have the Acom following the rig, and at the same time have the rig running in N1MM via a link from N4PY. Once set up, the amp follows the radio and pre-tunes it the band segment displayed on the Acom. There are other devices that he has created control settings for such as autotuners and panadapters. It runs in the background, but if you're using it with N1MM and enough room, you could add it to your N1MM window setup.
I downloaded as a 10 day free trial, and Carl N4PY even modified the software for me several times to get it working for my setup to make sure it would work for me as I wanted. Excellent customer service.
You do need a null-modem cable (make it yourself and only use pins 2,3, and 5, reversing pins 2 and 3 on each end for null-modem), but if you already have one for Acom Tools or Acom Director you should be ready to go.
I have no interest in n4py software, just a satisfied customer.

Hello to all,

after some mail conversation with ACOM, the error is history.

To find the error I changed the Vacuum relay against a new one, but this wasn´t the mistake.
After that, I changed the Condensor C14A, C14B, C15 on the Wattmeter PCB against new ones.
Also, I put a 1N4007 Diode betwen the ORC Point and a Ground Point.
I am not a specialist in SMD, so I put normal small condensors on the PCB. The distance between the
Wattmeter PCB and the Front Panel is very small. But with a little bit insulating tape on the backside of the frontpanel all works well.
So what can I say,
first a BIG THANKS to Val at ACOM. He send me a lott of photos and information to troubleshoot the
errors by myself.
That is real service !!

5856. Acom 1000 does not respond to PTT

From: stephen.bunting@...
Topic: 5856 Message: 5856

Hi everyone,

I'm looking for some advice about a fault my Acom 1000 has developed, please.

In short, it no longer responds to the PTT command from my radio. The radio and cable test fine with another amplifier, there are no fault numbers displayed by the amp at all, it starts up an behaves as normal. In standby mode, the amp power meter reads through power no problem. It operate mode, I apply power and it sits there looking at me, doing nothing. A bit like one of my kids when I ask him to do something.I have also applied a shorted RCA to the key input and still no amplification.

I last used the amp at a multi-op public engagement event where the amp reported a hot switching fault every 90 minutes or so. The cables were checked and the amp was reset a few times. By the end of the event the PTT had failed. I have been told (possible urban myth alert!) that "after a given number of faults the amp locks you out and needs a firmware reset". Any truth in that?. I see that the Acom website says

"Signatures of the amplifier internal status are stored in a nonvolatile memory for 7 most recent auto protection trips. This information is used for diagnostics.", but nothing else is documented.....

Any hints on how I can get the amp working again? I am happy to delve inside with a meter and then soldering iron.

Hello Zoli,

I hope not for faults but a share of experiences is always nice.
I started a Yahoo-group for this amplifier and you can find it on :
https://groups.yahoo.com/neo/groups/eto91/info
https://groups.yahoo.com/neo/groups/eto91/info
I can always try if there's interest in such a group ;-)

From: Jay Terleski
Topic: 5856 Message: 5858

There is a fault code spreadsheet you can get and or call you local rep Vine Antennas, and he can run the fault codes for you and help you troubleshoot the problem. It doesn't sound like a TR relay fault as it would specify a "hot switch" ORC fault. It sound more like a PTT input related problem the processor is not seeing the command signal to transmit and cycle the input and output TR relays.

5859. No Refl power showing on RCU?

Yahoo group: acom-list (2010 — 2016)
Date: 2014-05-10 14:06:31 UTC
From: Rich Hallman - N7TR
Topic: 5859 Message: 5859

I have three new ACOM 2000a's and all of these are working great so far. One issue I see is that I do not see any reflected power on the RCU. All three are the same, so I know there must be a setting I don't have right and haven't been able to find anything in the manual or online.

Any Thoughts?

Thanks...
Rich

Good Morning Rich,

7QP very well done. Bravo.

Out of the box, RCU should show reflected power, if you have any.

Which is to say, the RFL W LEDs will light, but on some bands, I have 1:1 and the RFL LEDs do not light. Which is good.

It may be that your antennas are all good enough that you don't light. Use low power and try a deliberate mismatch.

Hi Hank…

When I look at the actual reflected power under “measure” on the RCU and it says 57 watts ….But the bar graph doesn’t show any reflected power. What’s interesting is that all three amps are doing the same thing. I’ve tried multiple antennas and bands with the same results. Even high SWR on 80 meters, but the bar graph doesn’t indicate anything.

Thanks…
Rich

Wow. You should certainly see 57 watts on the RFL LEDs. Something not right.

Only other thing I can think of to suggest is to try it with key down instead of sending CW. Sometimes Reflected Power doesn't seem to keep up with CW. But, key down it always is there.

If no joy, call Guy at Array Solutions on Monday.

Problem fixed…

Bob at Array Solutions mentioned that the two RCA connectors MUST be connected to the AMP from the RCU cable and I need to key the amp from the RCU KEY-IN line. I didn't have these connected and was just keying from the back of the amp and not through the RCU.

All is working great now….

Thanks for all the help….

5866. ACOM2000A - terrible noise during POWER ON cycl

Yahoo group: acom-list (2010 — 2016)
Date: 2014-05-11 19:40:45 UTC
From: DL1AMQ
Topic: 5866 Message: 5866

As a lucky ACOM2000A owner I ran into trouble after more than 3000 hours of use.

After PA switch on there is a terrible and very loud noise during POWER ON cycle caused by internal blower (not the short sound by load/tune position motors). After few seconds up to 2 minutes the noise disappears and blower sounds like he did for years.
The strange noise sounds like defect gear mechanisms between motor axis and blower or blower wing scratches on blower housing or something else. There are no chips or any other failure indications visible.

Anyone else had this experience before ? Any hint what to do ?

Thanks in advance and 73 de Thomas, DL1AMQ

You are losing the blower motor. Time to order a new one. There have been three versions in ACOM 2000As.
The original was a Bomax motor running on 125 VAC. These had poor lifetimes. Its not a junky part however. The exact same motor is used in both the Alpha 87A and Alpha 99 for example. Bomax is out of business.
The replacement for the original - from ACOM - is a 12 (or 24?) VDC motor that has a small power supply bolted to it that converts the 125 VAC to 12 (24?) VDC.
If you buy a new amp today, you will get the replacement motor (12VDC or 24 VDC?) mentioned above, but not the little power supply, as ACOM has changed the design and now sends 12 VDC (or 24?) over to the blower from the main P/S.

Just to keep informed all of You, interested in solving the problem.

Yes, om Hal / N4GG is right. The blower motor had decided to take a rest
after 14 years of turning.
Because the blower can not be dismounted from the motor, ACOM offers the
currently installed into ACOM 2000A DC blower equipped with an AC/DC adapter
allowing its use in ?older? amplifiers, like mine.

I got the offer really fast by Val, LZ1VB (THANKS !).

One more time, I got fast support by qualified members of ACOM Yahoogroup,
such as Hal.
Enjoy Your ACOM.

Hello,
I have read on many different locations that the Acom 1000 is able to output its full power with 60 W drive.
My amp is not able to do that, I have to input 80 to 90 W to have 1 kW output with a bit less than 700 mA plate current.
Is this normal?
73

Hello Jean,

most certainly something is not right with your ACOM 1000.
700 mA plate current will ruin the tube pretty fast.
Please see the attached textfile that shows normal values.

My ACOM 1000 is ten years old, still the first tube and I use
it often for RTTY contesting. Drive (as read from the ACOMs display)
usually is 45 - 46 watts that gives my our legal 750 W output.
For RTTY I tune for maximum output at a screen current of approx. 40 mA.
Plate current with these settings is between 450 - 550 mA, depending
on antenna SWR.
Could it be that your tuning is not as it should be?

73 de Goetz DJ3IW

>Hello,
>I have read on many different locations that the Acom 1000 is able to

>My amp is not able to do that, I have to input 80 to 90 W to have 1 kW
output with a >bit less than 700 mA plate current.
>Is this normal?

The DC regimes at normal mains voltage are:

During RX: +2750...2770V anode voltage; SG voltage +340V for operate
and +12V for standby; Bias voltage -120V; Anode current below 1mA.

With PTT only: +2700V anode and same SG voltages; Bias voltage between
-65 and -75V, set for a 70mA low-level anode idling current, depending
on the tube specimen.

With PTT and very small RF drive: +2600V anode voltage, same SG voltage;
Bias voltage between -45 and -60V, set for a 220mA high-level anode
idling current, depending on the tube specimen.

During TX, 1000W (external wattmeter) @ 14MHz: +2380...2400V DC anode
voltage, same SG voltage, and 510-520mA DC anode current. The SG current
depends on the tube specimen but is usually between 10 and 20mA. The RF
anode amplitude (as measured on the LCD) is 150-200V below the measured
DC anode voltage.

On higher bands, the anode current gradually increases up to 560-580mA
on 52MHz and the DC anode voltage is around 2350V at the same time
(provided the mains is not "soft").

The power gain on 14MHz is 12...12,5dB up to 900-950W and it slightly decreases (-0,5dB) to 1000W. On the higher bands, the power gain might increase to about +1dB.

When ACOM1000 is normally loaded and tuned, the screen current is typically zero below 35-40W drive power and it begins to flow above 40W drive. Further increasing the drive, the screen current steeply increases, saturating to about 55-60mA at a 70-75W drive level. A current limiter is involved at this threshold.

The screen current might not appear if the plate loading resistance is too low, thus the anode instant voltage not reaching a low-enough value to approach the SG voltage for a higher SG current.

What band(s)?

With a good new tube one can achieve full output with <60W drive.

However, as the type dies, the symptoms are increased drive required to obtain same output. The degredation is seen on 6M and 10M first.

I had some newly purchased NOS tubes which couldn't put out 750 watts period.

It turned out to be a game of returning these newly purchased NOS tubes until one was finally received that put out the full KW.

Is the tuning smooth or does it “jump” up and down?

If it is “jumpy”, especially as you go to higher bands, you may have a failed component that may require more investigation.

Screen current varies greatly from tube to tube. Some source current,
some sink it. Screen supplies have to be designed to cope with this.

When we receive replacement Eimac 4XC5000A's at the old HF TX station
they always came with a test certificate which detailed the operating
parameters for that individual tube. No two were ever the same.
Loading was always to the required screen current at full power, 7.5kW.
Plate dip and screen peak generally coincided.

On 20M my 1000 delivers 750W with 8mA of screen current and 490-500mA
plate current. Indicated drive power 50W

Hello, To answer Goetz first, I am not running at 700 mA Plate current, it was for the testing purpose. I am usually running it at 700 W but was surprised to drive it with 60 W to have this result. Here is why I raised the drive to know what level to input is needed to have a kW output.
The tuning procedure is smooth, there is no particular jump.

I wonder if you are looking at the drive on the transceiver front panel or using something like a 'Bird' power meter.
Was caught out on 50MHz with both a TS-2000 and FT-847 showing more output into my amplifier than I expected. Checked it on a Bird and it was nearly 15 Watt lower than shown on the meter.
Also found the output meter on the Acom-1000 was well out, showing higher than on a Bird meter but adjusted the meter Pot.

Hi, All of this is measured with a calibrated LP-100A.
Btw, what is a safe Plate current value?
I think that the protection is set to 700 mA on the Acom 1000.

I can email you a copy of the Svetlana technical data sheet for this tube if you like, 132kB pdf.

Max rating 0.8A but typical DC plate current at 750W out in linear operation 550mA or less.

From the Svetlana data sheet:

"As a linear power amplifier, the 4CX800A will conservatively produce 750 watts PEP SSB, and 750 watts Key Down CW......"

What happens to the IMD at 1000W PEP is between you and the spectrum analyser.

Hi All,

My experience was almost the same in terms of output & input power as I turn the TS-2000 power to more than 70W (as I remember) to achieve the 1KW+

At the same time mine is set to 240V where as the standard supply is 230V, finally I wrote to Val, he replied that the perfect match of supply and settings will yield better result & life for TUBE!

Because it was my short vacation to back home from A7, I couldnt make more research, I hope this discussion will give more tips to get the 1KW out of 60W.

Guys,

The GU75B was designed for a 700-750 Watt RF. Sure at times it can be pushed to achieve a bit higher output, but when done to many times the output gets lower by the month of usage. End result? A new tube to install.

For an Acom 1000, keep RF OUT under 800 Watts peak and the tube will last likely long, very very long that is!

If you need more power buy a Acom 1500 instead.

Acom Bulgaria has finally released some dealer pre-release amps. Jay from Array Solutions posted his first Acom 600S video on youtube. It's a really short sneak preview where he's sending some morse code using full power on a dummy load. I also spotted the manual on another website.

After reading the manual I was a bit disappointed to see only one antenna connection. Since most recent Acom amps have at least two terminals, the new 600S has only one. I presume that Acom's remote antenna switch can be controlled just like my 2000a can.

According to the manual the final stage is build around two relative new Freescale MRFE6VP6300H transistors presumably in a push-pull combination, that can handle high SWR and have a disipated power of 300 watts CW up to 230 Mhz per transistor.

The Acom 600S supports cat control for most brand of radios but also has his own frequency counter on board to detect the band when rf is applied and switch bands according the signal.

I contacted my preferred dealer and according to him production is in place and first customers could get their hands on one around the end of June.

Jay's video: https://www.youtube.com/watch?v=3nxid2zooBw
https://www.youtube.com/watch?v=3nxid2zooBw
I will put the manual in the file section.

If I read the manual properly, power cutback starts at an SWR of 1.5.
It says it can tolerate 3:1 with reduced power.

Not what I expected from ACOM.

From: Mike Harris
Topic: 5883 Message: 5889

The quoted apparent ruggedness of the Freescale devices suggests that
this is somewhat conservative.

How reduced is reduced power I wonder. Para f. on page 14 would seem to
indicate that 2:1 is workable.

Regards,

Mike VP8NO

From: W1JCW
Topic: 5883 Message: 5890

What I was really expecting from Acom is a 1.5kw ss amp such as the SPE model.

After running my 2K, going back to 600 watts or thereabouts just doesn't do it.

If I read the manual properly, power cutback starts at an SWR of 1.5.
It says it can tolerate 3:1 with reduced power.

Not what I expected from ACOM.

We introduced it at Dayton for USD $2750.

The regular price will be $2789 beginning later this week.

From: on4vp@...
Topic: 5883 Message: 5892

John,

I do not entirely agree with you. First the 600S to me is more a mid class power contender for the KPA500. Compact, small, light, easy to use for dx expeditions or portable travel.

It would also serve well as a backup to my 2000a and having 600 watts on 50 Mhz to.
So I see it more as an extension to the 1010 or 1011 models with a tube.

Who knows Acom will release a more powerfull verion in the future to expand the legal limit range of amps like the 2000a and the 1500.

On the other hand, I think that when running a station with a good antenna (still the most important factor) a 600watt output or 1,2kw output would not make to much of a difference on the opposites stations s-meter. Once you cross the S9 benchmark, it gonna be hard to put another 10dB on the scale. That would mean you would have to go from 600 to 6kw ?

In my book, a good antenna system combined with medio power levels (500-800 watts) is a very well balanced system. It's nice to have legal limit in my house, but for 90% of the time I'm running my 2Ka only with 25 tot 30 watts of drive, and I'm almost always first call ;-). If you can't make it with 600 you won't make it with double power either.

I think it's more a 'between the ear' thing....

73 Phil

Right on Joel except, the last statement. It says 3db would make no difference in a pileup. I strongly disagree with that. It gets especially important in SSB and RTTY pileups. Having gone from 1500 watts to 600 watts, I really can tell the difference.

2-3dB can make a difference between having a QSO or not having one using FreeDV digital voice under weak signal conditions.

With DV, I am looking for a lot of signal margin to minimize the effects of 10 to 20+ dB drop in SNR under adverse conditions caused by multi-path or SSB QRM.

Keeping the SNR above 3dB, will avoid speech dropouts.

In general, however.. I agree with you Phil. I would rather have a better antenna than more power.

Mel,

Remember failed "desktop dB" can be easier to fix than failed antennas
-- at least for many of us OT's.

5897. Dust cover for the ACOM RCU-TFT Control

Yahoo group: acom-list (2010 — 2016)
Date: 2014-05-25 17:27:50 UTC
From: Rich Hallman - N7TR
Topic: 5897 Message: 5897

Living in the desert, we get our fair share of dust. With the new ACOM 2000's I just purchased, I wanted a way to keep the dust off the controllers while not in use. I contacted Stan at RadioDustCovers http://www.radiodustcovers.com/ and asked him if he could make the covers for me. I just received them last week and they looked fantastic. Wanted to share this with the group in case you were looking for covers. For what I had done, cost was around $26 each plus shipping.

You can see the covers on my QRZ page near the bottom. http://www.qrz.com/db/N7TR

Email Stan if you're interested...

Thanks...
Rich

There are no gears. The motor is self-centering and carries the blower squirrel cage to center with it. It is direct drive - one shaft.
The bearings in your blower motor are shot - the squirrel cage and its housing will be fine but if you have an original blower setup, it must be replaced as one unit.
Time to call ACOM and have them ship you a new one. They are very easy to swap out...

5899. ARC Fault Acom 2000a CW Full power

Yahoo group: acom-list (2010 — 2016)
Date: 2014-06-09 04:03:44 UTC
From: kenw817821@...
Topic: 5899 Message: 5899

I am getting an occasional ARC Fault. Reset and it works for awhile more before occurring again.
In the past an ARC FAULT has pointed to a loose coax connector, etc. This time that does not seem to be the case. It could be the connection that is 70 feet up in the air. I hope not.
Has any one ever seen am ARC Fault to be something internal to the Acom 2000?
Ken K5WK

5900. RE: [acom-list] ARC Fault Acom 2000a CW Full power

Yahoo group: acom-list (2010 — 2016)
Date: 2014-06-09 04:15:24 UTC
From: Ron Castro
Topic: 5899 Message: 5900

Ken:

I had a lot of problems with Arc Faults in my 2000A and finally traced the problem to a couple of areas. One was that my Ten Tec Orion II seemed to put out some very low frequency pulses and triggered the Arc Fault circuit, although there was no actual arc. A high pass filter fixed that. Another problem was that the bias in the Orion II needed a new pot and an adjustment. And finally, in my opinion, the Arc Fault detection circuit is just too sensitive, so I shunted R132 on the Interface board(100k Ohms) with a 47 k Ohm resistor. R132 is found on Sheet 7 of the schematics in Appendix A of the Technical Supplement.

To be clear, the factory does not recommend this mod, which I found by Googling around, but I did the mod back two years ago, and the only time I get an Arc Fault now is when there is really an arc in the antenna!

Your scenario is a problem outside the Acom 2000a. I was wondering if there is some flashing in the tubes, or similar.

I used to have Orions with the ACOM 2000 and had your problem. My exciter now is a K3, so I don't think its LF noise. But I am going to change out the driver coax to a different length just in case there is some frequency sensitive resonance there. I seem to see it only on 17 meters, and the Steppir does not show this on other bands. The other possible culprit is a MFJ RCS10 switch which I use with their RCS-12 automatic controller. I have never heard of one of those failing. As a precaution, I switched the beam to another position on the switch and still have the problem.

Thanks for you input.

hi

simple idea, test amp on a big dummy load and you will know if the issue come from amp or if it’s after the amp.

Arc fault is your friend! It tells you there is a problem! You should never defeat it. If you do, the possibility of amp damage and expensive repairs can be your next step! Then you'll come here and complain about the 2000A which is literally bullet proof!

I experienced intermittent arc fault alarms and I determined it was my Alpha-Delta antenna switch! I replaced it with a high end/quality switch and the arc fault alarms stopped.

I also had an arc fault alarm that led me to a right angle SO239/PL259 adapter/connector. For the life of me it looked fine, and when checked with a DC ohm meter it showed no defect....The arc fault kept alarming..I replaced it with a new one and the alarms stopped!

I suspect a small RF burn hole and the DC ohm meter never saw it!

Bottom line, verify your entire RF system is operating 100% Don't just look at coax connectors!.

A dummy load will help you isolate the outside coax and antenna!

Please come back and let us know what you found as the source.

HAD THIS WITH MY ACOM1000. MY RIG IS A FT5000.

it turned out to be LF spikes on TX when the rig is cold. due to its
circuitary design.
once the rig had got some heat into it, it didnt do it. acom sent me a
schematic for a LF filter for the input to the amp.

anyway sent the amp for a health check and all ok.

thinking back, peter hart when he done a review of the ft5k in radcom
commented on the LF spikes.

There are two subtle arc fault causes Ill list here - one is peculiar to the K3.

The first is PTT/TR timing. I often run SO2R here...either of my 2000As would be fine until I went to ping-pong CQs, and then they would occasionally arc-fault. It turns out with the logging program controlling the CQs, which has transmit delay built into the software (delay from PTT closure to keying) was getting shortened up. The rigs here have a menu item for transmit delay - I lengthen that just a little and the problem went away. Hot switching will give you an arc fault every time. You can be close to having no margin and not realize it. There is a transmit inhibit signal available at the back of the 2000A which when hooked up will prevent this from happening. Most folks don't hook that line up.

The early K3 design transmitted significant spurs, some out of band, when a large aperture antenna was connected to the additional antenna receive jack. A beverage was large enough to do it consistently on 160M. Something in the K3 overloads or mixes when it should not. These out of band spurs will trip a 2000A via arc fault. Elecraft "fixed" this problem by adding a carrier-operated-relay (COR) which shorts the receive antenna input to ground during transmit. Unfortunately, while its a fix for transmitting crud all over the band, its not much of a fix for causing arc-faults. The relay is slow enough, that before it closes you will get a burst of crud. It may only last a few mSec and won't bother others on the band, but it will trip out auto-tune amps. If you have a large antenna connected to that jack, you will need to add a receiver protector in line and outboard to the K3 to solve the problem. Array Solutions makes a good one.

I too, experienced an excess of arc-fault trips with my A2000a, Orion II combination. I too eventually traced the problem to the PL259/SO239 right-angle connector I used on the amplifier coaxial output port. I cannot tell by visual inspection who the manufacturer was, but removing it, and several similar trial potential replacements, permanently solved the problem.

I had some false conclusions, where further testing revealed answers. I managed to get some failures with tests that had been OK before.
Finally it showed to be the Steppir antenna, 73 ft in the air, a conclusion I did not want.
But, I took it down and found the coax PL259 connection to it was not quite finger tight, and
even tightening up without a pair of pliers got rid of the problem.
It has seen years of vibration, and this time it will go on with substantial help in remaining in place .
I will tighten with pliers, apply a layer of silicone tape, then shrink wrap the sucker.
Then shrink wrap it a second time. I think that should hold it.
As it turned out, my nylon messenger line up the tower also had a problem, so I am replacing it with coated wire cable.
That should hold it together for another 10 years!

5908. ACOM 1000 T/R Relay Replacement?

Yahoo group: acom-list (2010 — 2016)
Date: 2014-06-11 21:01:32 UTC
From: paul@...
Topic: 5908 Message: 5908

I need to replace the T/R relay in my ACOM 1000. I found a folder in the “files” of this group named VacRel_A1000. It contains some photos and a 2-page document about doing the replacement after the covers are removed.

I also found a document on removing the ACOM 1000 covers. It tells how to remove the top cover, discharge the capacitors, and remove the RF screen. I have done these steps, but it seems more must be removed to gain access to the T/R relay. A metal bracket covers the relay and other components. To remove the bracket, it looks like the front panel must be removed.

Are there any instructions available for removing the front panel? It seems to be fastened at the top by 3 screws and the bottom by 3 screws. The Tune, Load, and Band knobs will have to come off, and they have no set screws. Are they pressed on? I expect this has been documented. Can someone point me to it?

From: Jay Terleski
Topic: 5908 Message: 5909

You will need to remove the front panel.
Take the knobs off. Use your fingernail to flip the covers off the knobs
and you will see how to take them off from the hardware you expose.
A metric nut driver is recommended.

Then remove the screws on top and bottom of the front panel, it will flip
down out of the way.

Now you can get to the VAC relay coil connections, the bracket hardware is
now visible and you can see how it comes out.

5910. Acom1000 LCD backlight and power output reading

Yahoo group: acom-list (2010 — 2016)
Date: 2014-06-12 21:20:15 UTC
From: radiok7jq@...
Topic: 5910 Message: 5910

New owner of Acom 1000...two quick questions:

1. When turning on the mains switch on the back, the LCD backlight blinks on for a split second, and then goes dark with "Acom 1000" visible. Hitting the front panel power button to go online, the LCD backlight then illuminates OK. Is this normal?

2. I find the forward power reading on the amp to be about 6-7% higher than the reading on my Elecraft W-2 SWR meter. Then again, the W-2 might not be all that accurate. Comments on the amp's power output accuracy?

Other than these two minor queries, the amp performs great...quiet and tunes quick.

Yes - when the display is "dark", this is what they refer to in the manual
as the "Off Menu".

Neither of these meters is known for their accuracy. You need an Array
Solutions Power Master if you want an accurate wattmeter.

Note: The accuracy of the Acom 1000 Watt meter deviates from specs especially when the SWR at the antenna is anything else than 1:1.1.

A +10% is considered normal.

Very important to set those knobs to 0 or some known number before removing
so you will be able to set them accurately when reassembling.

Phil,

Perhaps you can explain how you have come to get "the first one sold in Europe" when Acom tells us they are not shipping production amplifiers yet?

Did you get a prototype unit from the Belgium dealer? As you can see on the back panel, this unit does not have the USA FCC certification number on it so it is not a production unit.

It likely will need modifications to match what will be produced later when they begin making them in quantity.

Bob,

CE mark is different from FCC and if ACOM has it they can sell the amp in EU
without problems.

I know that, but according to Acom, they have not completed final version of the 600S yet - and the FCC certification number will be on all production units regardless of what country they are sold in - just like every one of their other models. Certification was given by FCC for the 600S about one month ago.

Something is "fishy" as we say.

I's suggest they are being wise and shipping some
to the EU, a small amount and close to home. And
then, when it has been out a short while, with no
issues start shipping the world...where we require the FCC.

What transistors we used in 600S?

From: mailto:acom-list@yahoogroups.com

To: acom-list@yahoogroups.com
Subject: Re: [acom-list] Acom 600S in shack

I's suggest they are being wise and shipping some
to the EU, a small amount and close to home. And
then, when it has been out a short while, with no
issues start shipping the world...where we require the FCC.

From: on4vp@...
Topic: 5916 Message: 5923

The shipping label on my box says June 16th, and it arrived yesterday at the local dealer. Got a phone call to pick it up. It was boxed in two boxes (one inside other) and in plastic the manual on top of amp.

I was told it was the first shipment. I had last of the first shipment. I needed to wire a 240vac socket (like on the 2000a). Afterwords I did all testing stated in the manual.

At this moment I need to write to Acom for a few small things:

1/ Call sign is in greeting message but ACOM 600S is stil showing when booting.
2/ At present time I'm using analogue voltage to detect bands. The CAT of the Icom runs to beam controller and Acom 2000a. The 600S will follow bands only when in OPR mode and not while in STBY. Also 12 and 17 are not detected. Will check it this remains when choosing proper TTL insteand of dc voltage.
3/ Serial number in service page is not shown. It remains 000000.

Apart from above. Has been running all night. Stays cool all the time. Noise comparable with fans of tube amps. Driving it 17,5 watts to full output from 80 to 6m. PSU is great. Key down remains 52 volts all the time. 17,5 amps when full output.

Fets are Freescale new MRFE6VP6300H

Protection circuit is top notch. Display is great to look at and high resolution fb graphics.
So far pleased with the results. First impression is great.

I got news from Val (Acom) regarding a mail I sent to the factory. Acom told me that indeed 10 amps have been shipped. These are final products but Acom according to Val is still working on some minor software issues. Acom asked the dealer to pass this info to the customer.

At present time I found out that I have 3 minor software bugs.

1/ The hello message keeps showing Acom 600s no matter what text you put in the box.
2/ Using analogue voltage for band data, the 12 and 17 m warc bands are not selected (10 and 15 instead).
3/ The serial number on the fault log page is display as a bunch of zeros.

Val appreciated my feedback and Acom will address this software issues next week at the office.

So far the amp runs since Friday and I had it going through it passes on the All Asian dx contest cw.
It runs very cool and the thermal design is great. I'm not a runner in this contest. Most of the time only the fan of the power supply is running and some heat is dissipated from the PSU transistors. The large fan on the back has only had a brief run while I was testing FM/RTTY on a free spot on some bands.

Great to see is that even at full load, the power supply is quiet and does not drop in voltage at all. Remains steady at 52,2 volts. Keeping paddle down for over two minutes and no drops in power. Temp rised to 55° and first fan speed kicked in. At that time noise in shack is same as tube amp. When in STBY amp fans will not run since there's no bias power nor power at the fets.

Finish is on par with other Acoms. It handles fine and dimensions are almost the same as my Icom radio.
Just a bit higher. With 12 kgs I think it will be just fine taking on airplanes or distant locations for dx. I hope Acom will come with a carrying bag in time.

Val told me that a larger production of 600s will released to dealers real soon (2 weeks?).

I think I got lucky. It seems I'm the first ham with this nice champ on the bench.

Don't forget to clean your 2000A filter!

With contests etc. you need maximum air flow
to keep the amp singing!

Here in dusty Arizona I clean the filter every 3 months.

Martin,

This is a good reminder. Despite the filter maintenance, some other dirt can get in the amplifier and the blower forces it into the tube deck.

Even more critical (especially for older amplifiers), is some other maintenance that probably should be done about once a year and this is to *disconnect power first* and turn the amplifier up on its side, remove the bottom cover on the tube deck and clear out any lint or dirt that may have accumulated there.

In some amplifiers, even the fins of the tubes can get clogged. This would be an extreme case, of course.

Sadly, we have just taken in for repair one such amplifier and the entire bottom of the tube deck area was clogged and full of lint and other stuff. One of the tubes is bad, the other is on the way out. Because of this, other components in the amplifier have also been damaged due to overheating and operating out of spec. Sad, and totally avoidable.

Bob -

Can you access this area just from the bottom of the amp after you flip it over or is there more involved once you flip the amp over ??

I've never cleaned this area out but then again I have a clean house with no pet hair flying around as some do.

I've cleaned my filter several times now, and the material is getting ragged. There doesn't seem to be a supply of filter material available, and advice from Bob at Array Solutions was to get something from the local big box store. I have not found anything useful there.

Can anyone suggest what they might be using for the filter material? Cheese cloth is too dense, I should think -- but I've not seen any of that wiry plastic material anywhere. Maybe I just don't look well enough. Vic, W4VIC

I have used "Frost King" Polyurethane AC filter material for many years. It is 15"x24"x1/4" and can be cut easily, even washable. I usually just replace it.

I have the aux fan.

I cut out a piece larger than the fan/finger guard, fold it tightly over then secure with a rubber band.

When filter -starts- to turn "brown" from dust, I replace it.

I found the filter material at Lowes last time I bought it. Bob is right.. :-)

Mel, K0PFX

today when changing bands 20 to 40 with the usual "dit" the 2000a
did not follow the xcvr...

when i manually take the amp from 20 to 40 it works fine...
but will not rf sense...
and when i manually set to 20 , she jumps back to 40 ...
even though I'm trying to "dit" it to 20 ..... nothing happens.

on the display ,,,when xmitting , even with the amp doing power, the
freq measurement reads 0000....ugh

no rs232 hooked up ...

Cleaned the beast out this weekend and removed the tube intake housing cover.

All looked good for 1yr.

Not much debris at the intake access panel which I'm surprised because I never knew about this until

Jay sent his email .

Intake filter in the back was in good shape as well so no need to replace the material.

Good PM info guys!

Thanks!

Ken,

I've had a number of arc faults over the years and always swore up and down that the amp must be too touchy. However, in every case I did eventually find a culprit, usually after it got bad enough to diagnose more easily. My hits were:

1) A Cal-Av bead balun was arcing on 17m at high power and moderate (2.5:1) SWR. The yagi vendor swore it couldn't possibly be the balun because "those never fail". It was. When it failed hard I found it charred inside.

2) My 40M beam started arc faulting when in the higher SWR part of the band. I checked out connections, balun, etc and eventually found a cheap SO239 double female barrel connector that arced at high power. Replacement with a teflon one solved the issue.

3) Occasionally, I have had the gas discharge tubes in alpha-delta lightning arrestors arc at high power. I suspect some might have been the 200W tubes incorrectly installed, but in any case a swap fixed the issue.

4) I haven't had it happen yet with the A2000, but stray strands of braid or melted and warped center conductor on soldered PL-259s will do it. My system reliability went up after I switched to crimped connectors. (But only if good ones, with the right tools!)

So now, whenever I get an arc fault, I now assume the amplifier knows what it is doing, and I look for bad baluns, connectors, and any other connections/transitions. It's a very nice feature.

73,
Drew K3PA

Ciao Lorenzo,

As far as I know, first you need the R-P-A interface in your Acom 2000A.
You can get the RPA (Remote Power Adaptor) in Acom as accesory.

Then you can try a software like "Acom Director", for example.

Lorenzo

I built a unit to turn on the Acom2000A using a remote AC switch. Total cost about $30USD. Uses a Remote AC Switch and a delay circuit to close a relay for 1 1/2 to 2 seconds across the on/off switch.

I use Acom Director to switch between operate/standby. It was available on the web.

You have already received some good replies, but I will give you the information that I generally provide:

To turn the 2000a on and off, you need to add extra hardware. You can build this yourself as many have done, or buy the "Remote Power-on Adapter" from Acom through your dealer (cost is about 120 Euros). This is placed on the serial port at the back of the amplifier and looks like this:
http://k5fr.com/ddutilwiki/images/RPon.JPG http://k5fr.com/ddutilwiki/images/RPon.JPG

http://k5fr.com/ddutilwiki/images/RPon.JPG

http://k5fr.com/ddutilwiki/images/RPon.JPG http://k5fr.com/ddutilwiki/images/RPon.JPG

View on k5fr.com http://k5fr.com/ddutilwiki/images/RPon.JPG
Preview by Yahoo

Then you need software to control the Acom. Here are the four programs I am aware of:

AcomTools: http://www.acom-bg.com/ http://www.acom-bg.com/ (I can no longer find this on their web site but can mail it)

TRX-Acom: http://trx-manager.com/ is included with TRX-Manager (not free)

DDUtil: http://k5fr.com/ddutilwiki/index.php?title=Main_Page
Setup information for the 2000a:
http://k5fr.com/ddutilwiki/index.php?title=How_To#Setup_a_ACOM2000A_Linear_
Amplifier

Acom Director (MØYOM): http://www.m0yom.co.uk/ http://www.m0yom.co.uk/

Last, but not least, there is a combined hardware/software solution available from RemoteRig:
http://www.remoterig.com/wp/?page_id=1010 http://www.remoterig.com/wp/?page_id=1010
with the control by using a browser and not software on the PC

73,
Mitch DJ0QN

From: on4ct@...
Topic: 5950 Message: 5950

Dear

In a few days I will have an acom 1010 for repair work on my desk.
I have received the pictures R1 and R2 (White power resitors) on the main pcb are gone, the fuses next to the resistors seems the be good.
I suppose severe heating or high currents whipes out the resistors.

I think these resistors are the current limiting ones for the power supply, or the start up circuit.

I am in search for the schematics of this amp. I have found the manual on internet with one page of schematics, the main board is not in detail.

Has anyone experienced the same failure ?

Just to add my personal experience with trying to use the 2000A remotely. I purchased the RPON module from Array Solutions and hooked it up to the control PC. I also have the new RCU.

I use M0YOM's very nice software but be aware, there are faults that cannot be cleared remotely (Arc Fault being one).

I do not know if this is an Acom issue or a bug in the software as I have not had time to trouble shoot - and doing so would be no small effort.

In my case this left the amplifier running for almost 2 weeks until I could get back to the remote site.

Perhaps I was naive or overly optimistic, but bottom line, I would not recommend any solution using the 2000A for remote operation unless you also have a way to switch the A/C power to the amp remotely.

Acom really has made no effort to support remote operation IMO. There was nothing added with the new RCU nor have they ever produced control software or created API's for other developers to code to.

As far as I can tell the existing software is all reverse engineered and with that approach comes many pitfalls.

I love my 2000A's when I am in the shack, but Elecraft will likely get my business for an amp that works flawlessly remotely.

Topic: 5910 Message: 5952

I ran into the same quandary about what to do if the amp needs a reset, and came up with the idea of just wiring to the circuit board of the RCU “Enter” button and ran it to a remote controlled relay. While I was ‘in the neighborhood’, I hooked a wire to the “Power” button and hooked it to another remote relay, and I didn’t need the RPON module. Works like a charm in combination with the M0YOM software! I was working on a remote relay that would kill the 240 AC, but never got around to finishing it. So far, I haven’t needed it.

This setup also makes it easier to arm the auto-tune function, which never seems to work right by remote commands otherwise.

If you attempt this, you should use shielded wire and put a small RF choke in series with the connection to the buttons. I used those small ones that look like a resistor to keep RF out, plus ran the wires several turns through a toroid, and have had no RFI problems. The remote controlled relays are on an N8LP Remote control board, but any kind of relay closure at the remote site should work.

From the diagram it looks like you do not need the RPON but you need to
connect the AUX-1 out on the Remote Rig unit to two wires in the cable
between the amp and Acom RCU.

Click on the Acom tab on that link and it shows the connection diagram.

Hello Michal

No, the ACOM RPON is not required. Remoterig recommends a big 12V/230V relay to handle the main power line. In the box, there is a small relay which can be used as an actuator for the "big switch". So you can always do a hard reset even in case of nearly letal error messages. After many years of remote operations I can tell you, this little box saves you a lot of car mileage:-) You can even read-out all the parameters of the amp and there is a continous indication of power output and reflected power.

In my case this left the amplifier running for almost 2 weeks until I could get back to the remote site.

Perhaps I was naive or overly optimistic, but bottom line, I would not recommend any solution using the 2000A for remote operation unless you also have a way to switch the A/C power to the amp remotely.

Acom really has made no effort to support remote operation IMO. There was nothing added with the new RCU nor have they ever produced control software or created API's for other develop ers to code to.

As far as I can tell the existing software is all reverse engineered and with that approach comes many pitfalls.

I love my 2000A's when I am in the shack, but Elecraft will likely get my business for an amp that works flawlessly remotely.

Marcus,

It doesn't seem to indicate that this box has more than one channel. So, I assume to control both a rotator and an ACOM 2000a would require 2 units.

Is this correct?

Subject: AW: [acom-list] Re: Software ACOM 2000A

Hello Michal

No, the ACOM RPON is not required. Remoterig recommends a big 12V/230V relay to handle the main power line. In the box, there is a small relay which can be used as an actuator for the "big switch". So you can always do a hard reset even in case of nearly letal error messages. After many years of remote operations I can tell you, this little box saves you a lot of car mileage:-) You can even read-out all the parameters of the amp and there is a continous indication of power output and reflected power.

Markus,

Does the remoterig solution also require the ACOM RPON (Remote Power On Adapter) in order to power on and off the Amp remotely?

This nice little box will solve all your ACOM2000 remoting problems, running several 2000 remote for years now, never had a problem to do a remote reset and even autotuning works fine:

http://www.remoterig.com/wp/?page_id=1010#tabs-3

Forget about all the software solutions for the 2000, I never found one which is stable and reliable! The relay bridged switches on the remote panel are also a good solution for operate/standby or power on/off.

Betreff: RE: [acom-list] Re: Software ACOM 2000A

Just to add my personal experience with trying to use the 2000A remotely. I purchased the RPON module from Array Solutions and hooked it up to the control PC. I also have the new RCU.

I use M0YOM's very nice software but be aware, there are faults that cannot be cleared remotely (Arc Fault being one).

I do not know if this is an Acom issue or a bug in the software as I have not had time to trouble shoot - and doing so would be no small effort.

In my case this left the amplifier running for almost 2 weeks until I could get back to the remote site.

Perhaps I was naive or overly optimistic, but bottom line, I would not recommend any solution using the 2000A for remote operation unless you also have a way to switch the A/C power to the amp remotely.

Hello all,

I have a Acom 2000a with the new RCU and i am planning to buy an Acom 2000SW.
Is it possible to switch the Acom2000SW automatic to the right antenna when the Acom is changing bands ?

I think there's is a extra cable needed (DB9) between the Acom2000SW switchbox to the Acom 2000a RCU ?
Is this DB9 cable straight connencted or is it crossed in TXD/RXD ?

When someone has experience in the use of this combination , i am glad to read it.

Thanks in advance.

5959. Removing the Mains board on Acom 1000

Yahoo group: acom-list (2010 — 2016)
Date: 2014-08-03 02:16:53 UTC
From: paul@...
Topic: 5959 Message: 5959

I need to remove the Mains printed circuit board in my Acom 1000. I unplugged the connectors and disconnected the xfmr wires. I removed three bolts holding down the board, Now it seems all I need to do is release the board from seven plastic posts sticking up thru holes in the board. These posts have fins that flare out to keep the board down.

I can squeeze the fins with forceps, put a bit of upward pressure on the board, and get the fins thru the hole. This works OK, but after I get a few sets of fins thru their holes, the board gets captured by fins I have already released. Putting torque on the board does not seem to be a good idea.

Can anyone suggest an easy way to release the board from all the posts/fins without breaking anything?

Hi Paul,

Seven, egads. Consider some stiff round plastic tubing pushed down against the board. Finding the right diameter could be a challenge though. The tubing keeps the fins compressed but can be lifted up with the board. Haven't tried this though.

Sorry to see you have to dig into the bowels of the amp.

Thanks Rene,

I removed the bolt on 7805 and I was able to release the fins one at a time and pry up the board. To remove the Mains board, there are 4 bolts and 8 plastic posts. One post was originally overlooked because it is in a narrow space between R4A (large 10 ohm resistor) and the transformer settings block.

Howdy,

I'm looking at the ACOM 1010, 1000 and 1500 manual ACOMs. Now remember I'm coming from a pre 1989 world of glass tube (3-500Z mostly) amps.

How does an ACOM 1010 and 1000 use the same tube but have a 2X power out factor. Is the 1010 really babying the tube along (.5kw out on a .7kw tube) and the 1000 is pushing it (1kw out on a .7kw tube)?

Thanx for any insight, Skip

5972. Acom 1010 Tuning Problem

Yahoo group: acom-list (2010 — 2016)
Date: 2014-08-06 23:58:24 UTC
From: ab4bj@...
Topic: 5972 Message: 5972

I have a brand new Acom 1010 that I received today. I have connected it and am having difficulty getting it to tune. I am getting high reflected power and tripping the fault. I am using a G5RV and a SteppIR vertical. I am trying to tune on 75 meters. Before tuning, the G5 is about 2.0:1 and the SteppIR is about 1.07:1. On both antennas, when I reach about 450 watts forward, I hit 240 reflected and the fault trips. I have carefully followed the instructions to tune both antennas pursuant to the manual. I've checked all of my coax and have found no shorts or other problems. All coax was working fine with previous amp and with radio with amp out of line. The only thing I have found that is perplexing is that I have resistance between the center pin on the RF input port and ground on the amp. I don't have resistance between the center pin and ground on the two antenna ports. I suspect that this could be a short at the RF input connector but I have not opened up the amp to check at this point, but I've read and heard how solid the QC is on these amps, so I would be surprised if that was the problem.. Any ideas or suggestions would be appreciated. I'm not one to think that user error can never play a part! Thanks.

Skip

My understanding is it's basically the power supply and of course some less highly rated rf components in the A1010 compared to the A1000. The other difference is of course the A1010 does not cover 6m which also reduces the production cost.

A quick look at the schematics suggests that the HV on the A1000 is nominally 2080V while on the A1010 it is something like 1660V. Another difference seems to be the use of a voltage doubler in the A1010 - the HV from the transformer is 830V and then it goes through the voltage doubler circuit and is eventually rectified to 1660V DC. on the other hand the A1000 uses a full wave rectifier with the 2KV ac coming off the transformer.

Certainly the plate voltage differences will indicate the significant power differences. The Acom 1000 will start to warn at plate current exceeding 700mA so assuming they are both similar in that regard, the A1010 would be about 1162 Watts input and the A1000 about 1435W input.

Additionally the cooling system on the Acom 1000 appears somewhat better than that on the A1010 - and can be upgraded with an additional cooling fan for high duty-cycle modes while there is no provision for anything similar on the Acom 1010.

Hope that puts it into perspective. I'm speaking subject to correction and based on recollections from various previous posts and discussions and a quick look at the schematics.

i'm not an expert by any means but am a happy A1000 owner and have operated others in the line.

Before you do anything to the amp try running the amp up into a 50 ohm dummy load, if the fault still occurs then I suspect you may have and issue with the SWR detection within the amp.
But I would suspect its more aerial issues, the dummy load will prove it one way or the other.

Some more details: Acom 1010 has a "normal" 220v relay instead of a vacuum RF relay to switch the RF power. Also the capacitors in the tank circuit are not the sturdy "fail proof" Russian type Green/Grey coloured doorknobs, instead the dollar type normal electronics units are used.

I love the dual output on the 1010, but I do not understand why the 6m was dismissed in this unit. That would have set the sales of the Acom 1010 SO much higher for sure.

It will tune fine into the dummy load, so it's back to the drawing board with my coax and the antennas. I'm sure I have some glitch in there. Thanks for the input and advice. By the way, with the dummy load, I can only get the amp to output about 650 watts. When I add more drive, the G1 light comes on at 650. Any ideas?

Thats probably about right may just be your voltage bring slightly off mains Vs whats Set up on the amp. other issuue may be if its set for 110v and your voltage is Not stiff . maybbe that outlet feeding the amp is also feeding other things around the shack .

Has anyone compaired the fan noise between the Acom 1010 and the 1000. I have owned the Acom 1000 and the fan was very quiet and am considering the 1010, but hate fan noise.

Note: I am looking for comments from actual use, not your opinion.

Also does the 1010 have a loud T/R relay?

Thanks,

Joe N9VX

Joe

The 1010 does have a loud relay. Very loud when you have gotten accustomed to the A1000.

The 1010 uses a blower and based on previous observations I would not describe it as being loud. it is basically on par with the A1000. Having said that I have a shack with fairly high ambient noise - computer and its many fans which represent the limiting factors to my observations.

I always felt however like I could actually hear the A1010 whereas the Acom 1000 I always felt like I never heard. But I was always more conscious of the A1010 in operation compared to the A1000 - which I always felt very comfortable with.

For me, I don't think the fan noise will be a bother unless you are very sensitive. What will probably irritate you is the loud relay.

Regards and 73

For an Acom 1010 a 650 Watt output on a calibrated RF power meter loaded into 50ohm dummyload is the expected RF output power.

If you need more, get an Acom 1000 or 1500... (seriously, the Acom 1010 is not build to provide more RF. running it at lower RF levels like 400-500Watt, your GU74B tube will last long. However, driving the Acom 1010 to the max RF output with every QSO, tube will not last long at all. Stay at least 20% under max RF output is the advice.

The 220v mains needs to have a low voltage drop under full load. Reason for me to have fully rewired the shack mains with much thicker copper cables. Draining 10 amps from my 220v mains now only gives a 2 -3 volt drop :-)

With regard to your original problem, if you put the SteppIR into non auto track does the problem still occur, I have seen issues where due to common mode currents flowing in the shack the StepIR tries to auto tune to another frequency. The net result is that the linear sees this SWR change going greater than the trip point and the amp then shuts down, CORRECTLY.

Its just a thought.

With regard to the G5RV it is a good compromise aerial but that's what it is a compromise, the SWR will vary with frequency wind moving the aerial , trees blowing about near it etc. The protection circuit does not take prisoners its instantaneous, so try it with an atu and see if it sorts it, but its not the final answer and again you may have common mode current issues.

Throw up a quick and dirty 20 meter dipole trim it for a low swr and I bet your problem goes away.

Also you would be better on 220v ac, I bet it you measure your 110V ac line it will be all over the place on current peaks. You need a peak reading volt meter for absolute accuracy but a standard ac meter will give you an idea.

I hope that helps.

I can only fully agree, a G5RV is a nice holiday style antenna for low power experiments. Try a normal dipole with equal side lengths instead as suggested.

Very welcome Skip.

Can't say other than good things about Acom. Have had great experiences both with the amps and with the Head Office as well as from Array Solutions. At current prices they really are great value. For the additional benefits, operational information, 6m capability, higher power, RTTY operations - additional optional cooling, ease of changing operating voltages and troubleshooting features, I'd always choose the A1000 over the A1010 but there is another local ham who uses the A1010 and its light and quite small so I could see it's benefits to an op who is not active on 6m and who doesn't need a full KW.

Regards,

Dean - 8P6SH

My understanding is it's basically the power supply
and of course some less highly rated rf components in
the A1010 compared to the A1000. The other difference is
of course the A1010 does not cover 6m which also reduces
the production cost.

A quick look at the schematics suggests that the HV
on the A1000 is nominally 2080V while on the A1010 it is
something like 1660V. Another difference seems to be the
use of a voltage doubler in the A1010 - the HV from the

transformer is 830V and then it goes through the voltage doubler circuit and is eventually rectified to 1660V DC. on the other hand the A1000 uses a full wave rectifier with the 2KV ac coming off the transformer.

Certainly the plate voltage differences will indicate the significant power differences. The Acom 1000 will start to warn at plate current exceeding 700mA so assuming they are both similar in that regard, the A1010 would be about 1162 Watts input and the A1000 about 1435W input.

Additionally the cooling system on the Acom 1000 appears somewhat better than that on the A1010 - and can be upgraded with an additional cooling fan for high duty-cycle modes while there is no provision for anything similar on the Acom 1010.

Hope that puts it into perspective. I'm speaking subject to correction and based on recollections from various previous posts and discussions and a quick look at the schematics.

i'm not an expert by any means but am a happy A1000 owner and have operated others in the line.

Dean, Kees, et al.,

I'm about 91.321784% convinced the A1000 is the best choice for me.
However before I push myself to declare this a decision made...

Tell my why I might want to at least consider prying loose from my
shaking hands an additional ~$1400 for an A1500 besides the obvious 500W?

Thanx, Skip

Dean, Kees, et al.,

I'm about 91.321784% convinced the A1000 is the best choice for me.
However before I push myself to declare this a decision made...

Tell my why I might want to at least consider prying loose from my
shaking hands an additional ~$1400 for an A1500 besides the obvious
500W?

Thanx, Skip

Very welcome Skip.

Can't say other than good things about Acom. Have had
great experiences both with the amps and with the Head
Office as well as from Array Solutions. At current
prices they really are great value. For the additional
benefits, operational information, 6m capability, higher
power, RTTY operations - additional optional cooling,
ease of changing operating voltages and troubleshooting
features, I'd always choose the A1000 over the A1010 but
there is another local ham who uses the A1010 and its
light and quite small so I could see it's benefits to an
op who is not active on 6m and who doesn't need a full
KW.

I currently have the Acom 1000 - actually had a pair of them and regret having sold one of them. It is an absolutely beautiful piece of equipment. When I buy again I would consider the A1500 as a first choice - but the price (really my own budgetting considerations) might end up pushing me back towards the A1000.

The A1500 is built essentially in the same sized case (a big plus) but of course the major differences seem to be a heftier power supply/transformer, a heftier (and I believe more readily available tube) and a significantly better display.

If money is not the limiting factor - I'd always lean towards the A1500 even if I run it closer to 1KW output that tube would last forever. A number of manufacturers stopped manufacturing equipment with the 4CX800 tube. Alpha, TenTec and just about every Amp manufacturer (Ameritron excluded) a few years ago had a product with the 4CX800 tube. I believe Acom remains one of the few (the only one I can think of but maybe others) that still manufacturers equipment based on this tube. There was a scare in terms of availability and that seems to have scared the other manufacturers. Acom says they have a pretty good supply of these tubes and they remain available at reasonable prices compared to similar/ceramic tubes.

However the 4CX1000 seems to be a solid tube - I am no expert but I figure with Alpha and Acom using the tube there should be good supply going forward. I believe the 4CX1000 is still manufactured in relatively large quantities. The 4CX800 is apparently still being manufactured but new tubes are expensive. NOS tubes are however in good supply and seem to be at stable prices - remember Acom owns like a whole warehouse of these.

So as I said once money is not the issue spring for the Acom 1500 but if that is too much power you'll be very very happy with the Acom 1000. I've owned 2 for like 18 amp/years (one for about 10 yrs the other for about 8) and have had only 2 problems with them during the period and haven't changed tubes either - even though I've seem maximum power decline from around 1150w to maybe 955W as measured on my (non-calibrated) watt-meter. I usually drive them for about 500w rtty output so that's no been an issue.

Hope I've provided information that can help you make your decision. look forward to welcoming you to the Acom-owners club either way.

Acom considered to use a GU43B as tube while designing the A1500. Since the Acom 1500 was initially designed for the USA market (most buyers), they went into the direction of the 4CX1000 tube. a 4CX1000 tube cannot be bought against a low price here in EU.

GU43B and GU74B are widely available and affordable. I have spare GU74B tubes of year 2008, nice and shiny like the EIMACs . Many of these are still in the warehouses.

Just my 2cts :-)

My understanding is it's
basically the power supply and of
course some less highly rated rf
components in the A1010 compared
to the A1000. The other difference
is of course the A1010 does not
cover 6m which also reduces the
production cost.

A quick look at the schematics
suggests that the HV on the A1000
is nominally 2080V while on the
A1010 it is something like 1660V.
Another difference seems to be the
use of a voltage doubler in the
A1010 - the HV from the
transformer is 830V and then it
goes through the voltage doubler
circuit and is eventually
rectified to 1660V DC. on the
other hand the A1000 uses a full
wave rectifier with the 2KV ac
coming off the transformer.

Certainly the plate voltage
differences will indicate the
significant power differences. The
Acom 1000 will start to warn at
plate current exceeding 700mA so
assuming they are both similar in
that regard, the A1010 would be
about 1162 Watts input and the
A1000 about 1435W input.

Additionally the cooling system
on the Acom 1000 appears somewhat
better than that on the A1010 -
and can be upgraded with an
additional cooling fan for high
duty-cycle modes while there is no
provision for anything similar on
the Acom 1010.

Hope that puts it into
perspective. I'm speaking subject
to correction and based on
recollections from various
previous posts and discussions and
a quick look at the schematics.

i'm not an expert by any means
but am a happy A1000 owner and
have operated others in the line.

5998. 2000A - Heater Current Too High Fault on Startup

Yahoo group: acom-list (2010 — 2016)
Date: 2014-08-09 18:03:01 UTC
From: richardstasiak@...
Topic: 5998 Message: 5998

I have a circa 2002 - 2000A that has been trouble free up till now. I searched the archives for this problem and saw a couple of prior references but no documentation of the problem was resolved.

Problem description: A few seconds after turn on it is failing to off with a message "Heater Current Too High". It does the same on a restart, so I cannot get the amp on at all.

I don't know if this related but a couple of times during operating the amp before this failure I was getting the heater light rapidly flashing which indicates the presence of high heater voltage. I checked the mains reading and it was showing in the high 250's V on the RCU. I measured the incoming mains voltage with an RMS digital voltmeter and saw 239 V so I didn't think anything of it at the time.

Any suggestions on troubleshooting the issue would be appreciated.

Kees,

4cx1000As (@$200~$600) seem to be at least as available as the 4cx800A (@$150~$400).

I think the Alpha 8410 uses a pair of these 4x10s basically to replace some prior iteration that used a pair of 4x8s. So somebody at least is betting that the 4x10 supply will outlast that of the 4x8s. I'm not saying I subscribe to this just that somebody does.

I don't see 'nuff of a diff between these two tubes to make it much of a factor in a A1000 vs A1500 decision.

I read someplace the 4x10 takes less airflow to cool due to taller anode but I'm unencumbered by any actual knowledge on the subject. Is there any diff in the fans / cooling set up in the A1000 vs the A1500? Is the A1500 quieter?

Anybody have anything else that would drive them one way or the other between these two amps?

Oh there is the antenna out connection count thing.

Your tube prices are way different to what we pay here in EU...

PS: 400 dollar for an GU74B, mmmm I think I have a few of these tubes for sale right now for you :-) Year 2007/2008 tubes! Interested?
PSII: I bet you have already set your mind on an Acom 1500. Go for it and buy one man :-)

Subject: Re: [acom-list] Help with understanding ACOM

Kees,

4cx1000As (@$200~$600) seem to be at least as available as the
4cx800A (@$150~$400).

I think the Alpha 8410 uses a pair of these 4x10s basically to
replace some prior iteration that used a pair of 4x8s. So somebody
at least is betting that the 4x10 supply will outlast that of the
4x8s. I'm not saying I subscribe to this just that somebody does.

I don't see 'nuff of a diff between these two tubes to make it much
of a factor in a A1000 vs A1500 decision.

I read someplace the 4x10 takes less airflow to cool due to taller
anode but I'm unencumbered by any actual knowledge on the subject.
Is there any diff in the fans / cooling set up in the A1000 vs the
A1500? Is the A1500 quieter?

Anybody have anything else that would drive them one way or the
other between these two amps?

Oh there is the antenna out connection count thing.

Skip

Can't say other than good things about
Acom. Have had great experiences both with
the amps and with the Head Office as well
as from Array Solutions. At current prices
they really are great value. For the
additional benefits, operational
information, 6m capability, higher power,
RTTY operations - additional optional
cooling, ease of changing operating
voltages and troubleshooting features, I'd
always choose the A1000 over the A1010 but
there is another local ham who uses the
A1010 and its light and quite small so I
could see it's benefits to an op who is
not active on 6m and who doesn't need a
full KW.

My understanding
is it's basically
the power supply and
of course some less
highly rated rf
components in the
A1010 compared to
the A1000. The other
difference is of
course the A1010
does not cover 6m
which also reduces
the production cost.

A quick look at
the schematics
suggests that the HV
on the A1000 is
nominally 2080V
while on the A1010
it is something like
1660V. Another
difference seems to
be the use of a
voltage doubler in
the A1010 - the HV
from the transformer
is 830V and then it
goes through the
voltage doubler
circuit and is
eventually rectified
to 1660V DC. on the
other hand the A1000
uses a full wave
rectifier with the

2KV ac coming off
the transformer.

Certainly the
plate voltage
differences will
indicate the
significant power
differences. The
Acom 1000 will start
to warn at plate
current exceeding
700mA so assuming
they are both
similar in that
regard, the A1010
would be about 1162
Watts input and the
A1000 about 1435W
input.

Additionally the
cooling system on
the Acom 1000
appears somewhat
better than that on
the A1010 - and can
be upgraded with an
additional cooling
fan for high
duty-cycle modes
while there is no
provision for
anything similar on
the Acom 1010.

Hope that puts it
into perspective.
I'm speaking subject
to correction and
based on
recollections from
various previous
posts and
discussions and a
quick look at the
schematics.

i'm not an expert
by any means but am
a happy A1000 owner

and have operated
others in the line.

Regards,

Dean - 8P6SH

some less
highly rated
rf components
in the A1010
compared to
the A1000. The
other
difference is
of course the
A1010 does not
cover 6m which
also reduces
the production
cost.

A quick
look at the
schematics
suggests that
the HV on the
A1000 is

nominally 2080V while on the A1010 it is something like 1660V. Another difference seems to be the use of a voltage doubler in the A1010 - the HV from the transformer is 830V and then it goes through the voltage doubler circuit and is eventually rectified to 1660V DC. on the other hand the A1000 uses a full wave rectifier with the 2KV ac coming off the transformer.

Certainly the plate voltage differences will indicate the significant power differences. The Acom 1000 will start to warn at plate current exceeding 700mA so assuming they are both similar in that regard,

the A1010
would be about
1162 Watts
input and the
A1000 about
1435W input.

Additionally
the cooling
system on the
Acom 1000
appears
somewhat
better than
that on the
A1010 - and
can be
upgraded with
an additional
cooling fan
for high
duty-cycle
modes while
there is no
provision for
anything
similar on the
Acom 1010.

Hope that
puts it into
perspective.
I'm speaking
subject to
correction and
based on
recollections
from various
previous posts
and
discussions
and a quick
look at the
schematics.

i'm not
an expert by
any means but
am a happy
A1000 owner
and have

operated
others in the
line.

Regards,

Dean -
8P6SH

The tube issue and price is a difficult one unless you are comparing like with like.

I am not really big on NOS tubes because I don't like the idea of possibly having to de-gas them by "burning them in" or "cooking" them as I call it - placing them in the socket and running them without the HV attached. I'd rather not do that.

I would therefore faster buy a tube from say Array Solutions which has been gettered and tested. These tubes will naturally cost much more than NOS that have not been gettered. That's purely a personal preference but I think that is where the price difference is. Naturally when I buy from Array or somewhere similar I'm buying into their overhead which tubes'r'us dot com may not have. Again not suggesting one way is better than the other just my personal preferences.

Certainly if you have the A1000 there is no need for anything else. If buying new this is a very useful debate as there are factors which would influence the decision - some are marketing - three outputs for example. Most stations with multiple antennas probably already have some kind of switching and for my SO2R setup - I don't need it. if you're just setting up a new station it could be a big deal - saving some bucks.

As to the matter of tubes. What I represented is what I understand the situation to be viz a viz the two tubes. There is a lengthy explanation on the Array website that seeks to clarify the 4CX800 issue.

The A1500 is now one of the cheaper, high-quality 1.5KW amps on the market. normally we would not even be discussing a KW vs a 1.5KW amp - so it speaks to their very competitive positions that the KW amp is good enough quality and price to be considered in a 1.5KW world and vice versa.

The decision will not be an easy one and i could understand leaning towards the cheaper model afterall this is a hobby and at the current price-point, it is really serious value. It was good value when the price was nearly a thousand bucks more!!!

73 and best regards,

Dean

- while the A1500 based on its price

Hans,

There are many resources for GU74B. Even three amateur radioshops in The Netherlands sell tested and guaranteed GU74B tubes against very reasonable prices... Getting a spare GU74B is nothing special as long as the NOS stocks do not dry up. On HAM events often sold as well.

To sum up: Obtaining a GU74B tube is nothing special, some make it a mistic & difficult to get object. It is NOT.

All,
As an FYI, I purchased 2 NOS tubes from Vine a couple of years ago falling victim to the PANIC that they are no longer going to be available. I paid $500 USD and they are still in the original box sitting on my shelf waiting for a failure with my Acom 2000a. At my age there is a chance I might fail before my tubes in service do...hihi

Kees,

Agree if you are in the Netherlands. I am not.

Several years ago, it took three returns to finally get a good one from a reputable EU supplier. They were all "tested". It turns out they were tested to 400 W in an ACOM1010. They would not deliver more than 600 W in an ACOM1000.

Except for one source in the US, we have to purchase international. International returns of out-of-spec tubes are a real pain.

The picture is much different here.

I can get John Deere tractors here easily. I suspect they would be difficult to find in EU.

Rick - I have had the blinking heater light problem at start-up for a few months. However, the amp continues to work just fine. I am also interested in a detailed description and fix for this problem.

Hi Brian,

Why not buying from abroad then? I do the same all the time if I cannot get / buy what I want locally? The Netherlands is so small, we need to do that all the time. Simple solution to many searches :-)

What you need is a reliable source for your tubes.

Kees

I think your point is well made. Having said that within the EU there are certain protections, benefits and courtesies which you enjoy when purchasing from other EU countries.

The complexity of purchasing from overseas is compounded by often difficult (and sometimes arbitrary) customs standards both tariff and non-tariff barriers.

As a matter of course I purchase ham gear in the USA and try my best to purchase in a way that allows me to travel with that gear rather than ship it. That eliminates often the complex paperwork and uncertainty, not to mention the sheer high cost of shipping. I did have two experiences shipping antennas from EU for example and I thought it would have been easier and cheaper trans-shipping via USA (based on quotes from shippers) but in the second case, I used Fedex direct to 8P and this ended up cheaper and much more cost-effective. Technically the shipping was much more expensive but it was all the other "handling" and other costs that made the "via USA" option much more expensive and with longer transit.

When I do ship from USA is much easier to maintain a USA address because the paperwork which is required in Barbados is usually not provided by US companies - the International Commercial Invoice (I think it's called). This leads to long delays even when sent by FEDEX and the like.

For hams in South America I am sure the problems are similar. When the values are declared and the packages are so small, it is not unheard of for these packages to simply disappear or arrive empty. Again more paperwork, uncertainty, delays and frustration.

Add to that the potential problems of say eBay or some other website and it can just be really bad experiences. naturally if this happens once or you hear of problems from others it is the brave soul who puts his money down knowing the risks involved.

I currently need a transformer from Acom. The shipping is maybe 33% of the quote. It's heavy - I know. To an EU address shipping is however negligible.

Anyway back to the radio my friend. Now if only 6m would open!!!

Hi Dean and others,

Yes, I also encounter a times problems with shipping or receiving goods, but again The Netherlands is such a small country, that buying in other EU countries or overseas is pretty common.

Some hints: At all times select secure shipment. Never accept an opened parcel. Make sure the shipment is secured and email the shipper the necessary instructions with the correct custom clearance codes and the proper ways to pack the parcel etc.
Believe me, I shipped quite some ham stuff, and received over time too. Sometimes it goes terribly wrong, but in 9 out 10 all is fine when well prepared at both ends. Buying by persons or companies who do not act like I want them to act, simply do not get my business.

Indeed, it is time to go back to the radio :-)

Hallo
After receiving the schemactis, I went to analyse the main board.
Also Stan from Acom, during his holiday , send me guidelines in a search to the faulty components.
I blew a couple of fuses on the main board (0,8 A) during start ups by elimating some parts. The suspected parts where transfo, hv components and the tube.
Finally I found a blown high voltage capacitor (blue 2200 pf/6kv) after the anode coil.
This DC blocking capacitor shows a litlle black trace, the second one seems ok.

Without these capacitors and without any tx connected, everything runs well.
During this test the tube gets hot, the tubes was then running idling. The fan was sometimes running sometimes not. I found pieces of the blown resistor R1/R2 inside the ventilator house and hold the fan to a stand still. So I had to clean the fan house.

Now I have an order on such capacitors.

Both UR7GG and LY2MQ sell tested/burned-in GU74s (and other ex-USSR valves) each year at Friedrichshafen

UR7GG offered me a money back guarantee for the following year as he ran out of tested stock on one occasion, but they were OK.

They are there each year so Im sure they are reliable

There are other occasional vendors as well

The "rarity" of GU74s is an annual rumour at FDH, although not this past year as I recall.

Hans,

There are many resources for GU74B. Even three amateur radioshops in The Netherlands sell tested and guaranteed GU74B tubes against very reasonable prices... Getting a spare GU74B is nothing special as long as the NOS stocks do not dry up. On HAM events often sold as well.

To sum up: Obtaining a GU74B tube is nothing special, some make it a mistic & difficult to get object. It is NOT.

We have many of them in stock, right here in the USA.

Not an issue to obtain them at all.

Thanks to the people who answered my questions. A special thanks to Jay Terleski, WX0B, of Array Solutions in Sunnyvale, TX. Jay provided some technical information including voltage charts. I bought my amp used from another ham some years ago, but Jay gave me excellent free advice. I recommend buying from Array Solutions.

My problem was low screen-voltage in the 340 volt supply. I found an electrolytic in the circuit leaking at its base, but it was not the cause. It turned out to be bad transistor Q8. I also replaced seven electrolytics on the mains board since I had it on the bench.

ACOM 2000P SPECIFICATION:
1. Frequency Coverage - 3-30MHz continuously in 7 sub-ranges:
A 3 000 - 3 800 kHz;
B 3 800 - 5 700 kHz;
C 5 700 - 8 500 kHz;
D 8 500 - 12 000 kHz;
E 12 000 - 18 000 kHz;
F 18 000 - 22 950 kHz;
G 22 950 - 30 000 kHz.

2. Power Output: 1500W PEP or continuous carrirer modes, no mode limit.

3. Intermodulation Distortion: Better than 35dB below rated output.

4. Hum and noise: Better than 35dB below rated output.

5. Harmonics Output Suppression: Better than 50dB below rated output.

6. Input and Output impedances:
- nominal value: 50 Ohm unbalanced, UHF (SO239) type connectors;
- input circuit: broadband, VSWR less than 1.3:1, 3-30MHz
continuously (no tuning, no switching);
- output matching capability: better than VSWR 3:1 or greater at
reduced output levels; automated.

7. Tuning:
- Initial Antenna Impedance Matching: automatized, tuning time less
than 3s, no skill requirements for operator;
- Band Change - less than 1 second;
- Segment Change - less than 0.2 seconds.

8. User Tunings Memory - non volatile for up to 10 antennas per each frequency segment and/or band (tunings for 50 Ohm default provided).

9. RF Gain: 14.5dB, frequency response less than .5dB (50 to 60W drive power for rated output).

10. Tubes: two 4CX800A (GU74B) Svetlana high performance ceramic metal tetrode with plate dissipation of 800W each, forced air cooling, grid driven.

11. ALC: grid-current derived, -11V max, rear panel adjustable.

12. T/R System: QSK operation with built-in vacuum RF antenna relay.

13. Protections: cover interlock for operator's safety, inrush power - on current, all supply voltages and currents, cooling blower, exhaust air temperature, antenna matching quality, reflected power, RF arcs (incl. in antenna system), overdrive, T/R sequencying, unauthorized access to amplifier (password), "INFO BOX" for 12 recent protection trips etc.

14. All functions accessible from PC via RS232 port, network functions for more than one set of amplifier/antenna unit in one common local network.

15. Measurement and/or monitoring of 20 most important parameters of the amplifier via RCU and/or PC.

16. Primary Power: 90-132V (100 & 120V nominal taps, 10% tol.) and 180-264V (200, 220 & 240V nominal taps, 10% tol.), 50-60Hz,single phase, 3500VA consumption at rated output power.

17. Size & Weight: (W440 x D500 x H180)mm, 36kg (operating).

18. Operating environments:
- temperature range: 0...+50 degs.Celsius;
- humidity: up to 95% @ +35 degs.Celsius;
- height: up to 3000m above se level without output deterioration.

19. Storage and shipping:
- Shipping weight – 43kg.
- Shipping size: W390mm x D330mm x H350mm - Transformer carton;
W630mm x D590mm x H310mm - Amplifier carton.
- Environments: all types of transportation, incl. aircraft baggage section up to 12000m above sea level.

ACOM 2000A, only for HF amateurs band...

Topic: 6023 Message: 6023

So, is there any hardware difference between the A and the P model, or is it just the firmware in the control circuitry which prevents operation in the out of band regions?

Also, are there any frequencies in the standard model in which the plate choke can be an issue? Or is the plate choke the same on both models?

They are different in many ways.

The first is that the P only covers from 3 to 30 MHz. No 160!

The 2000A has frequencies where it will not work, the P does not.

Why is there any interest in the P model? What for?

6025. Acom 2000A temp question

Yahoo group: acom-list (2010 — 2016)
Date: 2014-08-27 16:57:26 UTC
From: nu6x@...
Topic: 6025 Message: 6025

For the last several years I have been running my amp (2000A) underneath my desk set on its side in a vertical position. It has good ventilation. It seems to be running hotter than I remember but that is subjective.

What is a typical exhaust temp. running 1500 watts SSB after a 2 or 3 min transmission???

Will a standard 120 mm computer fan work on the back??

Thanks Mark NU6X Sedona, AZ

My interest would be for MARS. Because 2000P is advertised as MARS / CAP ready I am concerned the model 2000A would not work with MARS.

If 2000A works with most MARS frequencies near the Ham bands then there is no need for me to purchase 2000P.

Can you confirm 2000A is MARS capable near the Ham bands?

From: Skip Guenter
Topic: 6025 Message: 6027

If it's anything like my computers sitting down there... it probably
needs the air hose taken to it.

Personally I like the setting on the compressor just below "blows
components off the PC board" about 70psi. ;-)

From: W5OV@...
Topic: 6023 Message: 6028

Yes, the 2000A does work above and below the amateur bands.

The following is the spectrum "chunks" where the 2000A operates.

Fmin Fmax (in kHz)
1750 2025
3200 4700
6700 12500
12500 15600
17100 30000

So, if your MARS frequencies are in those ranges, the 2000A will do it.

6029. 2000A fan speed

Yahoo group: acom-list (2010 — 2016)
Date: 2014-09-06 04:07:57 UTC
From: Bill Turner
Topic: 6029 Message: 6029

I'm a new 2000A owner, just a couple of weeks, and do mostly RTTY. After doing two RTTY contests, it seems to me the fan speed is a little low and the amp runs hotter than I would like, even with the optional external fan. Has anyone modified the main blower circuit to increase speed? I wouldn't do it while it's under warranty but would later.

All comments appreciated.

73, Bill W6WRT

I had this discussion with Jay @ Array Solutions.

He (they) say just operate, the external fan is not necessary... for what it's worth.

The ACOM2000 generates a lot of heat at 1500 W RTTY. In the winter RTTY contests, it used to raise my shack room temperature by 15-20 degrees.

The ACOM 2000 has over temperature protections which will kick in if things get too hot. Then you have to do something.

REPLY:

Yes, I've had the main blower jump to high speed twice while contesting with RTTY and it certainly catches your attention when it does. I'd like to increase the normal blower speed to try to avoid that.

The owner's manual has only a partial schematic, not enough to show how to modify the blower speed. How does one get a copy of the entire schematic?

REPLY:

I would agree the external fan is not necessary for CW or SSB but I disagree about RTTY. I do have the external fan and if I don't keep an eye on the temperature bar graph while running, the blower will kick into high speed. It's done this twice to me and once it kicks in it takes a long time to cool down.

I think the answer is to increase the normal blower speed. The ACOM designers have, in my opinion, chosen to run the blower very slowly in order to keep the noise down, and they succeeded quite will for CW and SSB, but it's marginal for RTTY.

I had this discussion with Jay @ Array Solutions.

He (they) say just operate, the external fan is not necessary... for what it's worth.

.....OK lets put some more information into this comment. The external fan will not come on until a temperature threshold is exceeded as sensed by the two precision temperature sensors in the tube chimneys. Usually they will not kick the fan on at all with CW, SSB modes of operation. My 2000A is used heavily in contests and I have never ever heard it come on.

For RTTY contests I would say it is probably a good idea to have it to cool the power supply section of the amp. Val or Stan should comment more on this. It is possible to even wire the external fan to the 24VDC power supply to have it on at all times, if you can live with a bit more noise. I will probably do this with my 2000A since I have it on a rear table behind the operating table. So it won't be heard. It is time for me to replace all the electrolytics in this 2000A since it is going on 15- 16 years old so will rewire it so the fan comes on all the time.

Also we have had a couple of 2000As come in that were totally filled with dust that clogged the tubes cooling fins as well as air filters. The tubes were ruined. You can tell an overheated tube by examining the green temperature strip on the outside of the cooling fins. If it is turning brown or is brown the tube was overheated. So before the contests start this fall, take the covers off and open up the tube chamber's bottom plate and blow out the dust, clean the air filter, and have fun.

Topic: 6037 Message: 6037

I'm a fairly new 2000A owner and trying to get the K3 and 2000A to communicate properly.

I am using two different logging programs, DXLab and N1MM Logger.

I have the CAT cable with Y-adaptor plugged into the K3. I also am running a P3 panadaptor, but I don't think that is involved in this issue. I could be wrong.

When I am NOT running either program, the K3 and the 2000A communicate properly, i.e. changing bands on the K3 makes the 2000A change bands normally.

Likewise, when the 2000A is turned off, the K3 communicates to both programs correctly, i.e. either program reads the VFO frequency normally.

The problem happens when I have the K3, the 2000A and either logging program running all at the same time. Communication is lost and I get error messages saying "the radio on com1 is not responding" and the like.

I'm running out of ideas. Any suggestions?

It's not completely clear to my simple mind how you are hooked up.

Here's what I have and what works for me.

K3, P3, 2000A, N1MM.

RS232 between K3 and P3 with a tap pickoff going to ACOM RCU. RS232 from P3 to computer.

Is that your configuration?

Put the Y cable between the P3 and the computer etc, not on the K3 side. . The
K3 to P3 serial cable should not have any other devices sharing it.

Eric is right of course. My previous post on ACOM tap placement was wrong.

Note, at least at W6SX, the ACOM does not follow K3 unless something is
polling the K3, for instance a logging program. A single dit or pff solves
that "problem."

REPLY:

I think so, but just to clarify: I have the "root" of the Y plugged
into the P3 jack labeled PC. One "arm" of the Y goes to the computer
and the other "arm" goes to the 2000A.

Is that correct?

I also tried it with the root of the Y plugged into the K3 and one arm
going to the P3 and the other arm going to the 2000A. Same non-results
as the other way.

Bill

I have the same but not yet configured

With the SPE2K you make the amp only "Listen" to the RS232, while the rig/PC have 2 way communications

The amp is only connected to the RXD of the 232 plus a ground, no TXD

My amp is an ACOM, not an SPE, but I will look into the TXD issue.
Thanks.

Page 32 of the Acom handbook is pretty clear, fig 7-2

The Acom is only in listen mode, no connection on pin 4 of it's CAT ocnnector when sued with a radio and logging programe

Do you have all your devices set to the same and correct RS232 speed?

The reason I bother is I do not like transmitting even a single dit
into an amplifier on the wrong band at full power. Yes, the ACOM is a
tough amplifier but I am pretty conservative about such things. When I
do send a dit to change bands, I reduce the drive power way down. If I
can get the automatic band change to work, I won't have to reduce
power or send a dit. It will already be pre-tuned.

Try changing the com port to 2 or above. Com 1 on most computers is reserved for a mouse and or keyboard.

Hi Bill

Did you build your cable according to schematic on page 34 (figure 7-6) from Acom 2000 manual? This wiring diagram is for K3 CAT with ACOM 2000A only. I believe this diagram assumes there is no computer connected in. It only describes the case in which there is a connection between the K3 and Acom 2000A.

If you look at the page 32 (Fig 7-2) which describes the "generic" wiring between RS232 PC port and Transceiver with ACOM connected via "Y" cable, you will notice that they only use the RXD wiring and the ground. TXD line has been omitted.

RCU DB15 Pin 1 <-------> RS-232 Pin 2
RCU DB15 Pin 5 <-------> RS-232 Pin 5 (Ground)

I initially built the CAT cable using all 3 wires (RXD, TXD + Ground) and as soon as ACOM would come online, K3 would not work properly with my LP-PAN and LP Bridge. I don't use P3.

I snipped the TXD line after reading your email and now everything appears to be working fine. K3+ACOM2000A+PC are tracking frequency smoothly like usual.

If I now just type the frequency in Win-Test or change the band on my K3, ACOM nicely parks itself on a whichever band segment it detects by sniffing the comm traffic between K3 and the PC.

My cable is store bought, and it is the kind in figure 7.2, i.e.
without the TXD wire. I ohmed it to be sure. Actually, it is a cable
with a separate Y adaptor, but the effective wiring is the same as
figure 7.2.

And here's the kicker: This morning when I fired up everything to do
some more troubleshooting, everything worked just as it should. It
seems I have an intermittent connection somewhere, most likely in a
cable, connector or the Y adaptor. It's been working fine all day.

I think I will build a new cable and Y adaptor to eliminate that as a
possible cause and see if the problem stays gone.

I did notice one thing that seems odd. When I do not have a logging
program running and I do a manual band change on the K3, the ACOM does
not follow the change. I thought it should. Does your's work that way?
As soon as I start a logging program, everything returns to normal.

Don't you just love these intermittent gremlins? :-)

REPLY:

So the K3 does not send data unless polled? OK, now things make more sense. This explains why, if you're not using the Y connector to your computer, your data cable must have the TXD wire so the ACOM can poll the K3.

Is my assumption correct? The ACOM does poll the K3 in that case?

Things are finally coming clear. I wish this had been explained in the ACOM manual.

Many thanks to all who replied on this issue.

Hi Dick and Val
Thanks for sharing this valuable info with the group.

Similar to Bill, W6WRT after I fixed my CAT cable to exclude TXD line my entire setup started working but later on I realized it wasn't working reliably. On some occasions, amp would not detect the frequency change until after I started spinning the VFO knob. This was while I had the Win-Test logging program running and polling my K3. Autonfo on my K3 is set to "nor".

On some bands the amp refused to follow the frequency. For example, I would switch the radio to 20 meters but the amp for some reason thought it was still on 15. If I turn the CAT off on the Acom's RCU unit and transmit some RF, the amp would correctly switch to 20 and tune up. Without changing anything else and while the K3 and Win-Test were still on 20m, if I turn the on the CAT on the RCU unit, the amp would jump back on 15m for some reason.

The whole thing started working reliably after I took LP Bridge out of the picture. In Win-Test if I define the radio on the real COM port the PC is connected to the K3 and change the pooling from "Auto" to 300msec the amp works well. I changed the band numerous times and Acom followed without a hitch.

In my case LP-Bridge seems to be confusing the amp but I can't tell why. LP-Bridge does read everything correctly from the K3 and Win-Test works perfectly along with it.

Hi All

Just recently got a 2000a , 2011 model I wish to use it with my computer and use a Acom Director software
My Pc is running on windows 8.1 , my pc only has usb ports on it....
So fat I have tried using a usb to 9 pin rs-232 with the ftdi chip in it. At the end of the lead I have connected a null modern lead and connect it to the rs-232 pin on the acom, also the rcu unit is still connected. the rcu unit is not the new one....
Any ideas Please.

6055. ACOM 2000A Microprocessor Conflict

Yahoo group: acom-list (2010 — 2016)
Date: 2014-09-30 19:35:32 UTC
From: K0DAN
Topic: 6037 Message: 6055

Just turned on the amp, which was working fine a few days ago, and just got a "Microprocessor Conflict" protection fault, which shuts down the amp. Amplifier starts its power-up sequence, throws the error in about the first 10-20 seconds.

All I can find in the manual is the "OFF5" recommendation (to turn off the amp for 5 minutes and try again). No joy.

I reseated the connector to the RCU, removed power from the amp and RF deck for an extended period, no joy.

This is an early serial # of the 2000A, and has the old style RCU.

Has anyone had any experience with this error, and any suggestions where I can research a repair?

Thanks and 73,

Dan

Some of the oldest units had a "socketed" chip in the RCU. Sometimes, the pins on the chip would corrode and become intermittent. You can take the RCU apart and try moving the chip slightly - you don't need to remove it - just lift it a little at both ends and re-seat it flat into the socket. This should scrape the pins enough to make a better connection. This happened in mine about 10 years ago and has not happened again.

Some of the oldest units had a "socketed" chip in the RCU. Sometimes, the
pins on the chip would corrode and become intermittent. You can take the
RCU apart and try moving the chip slightly - you don't need to remove it -
just lift it a little at both ends and re-seat it flat into the socket.
This should scrape the pins enough to make a better connection. This
happened in mine about 10 years ago and has not happened again.

6059. Re: [acom-list] ACOM 2000A Microprocessor Conflict

Yahoo group: acom-list (2010 — 2016)
Date: 2014-10-01 21:36:37 UTC
From: K0DAN
Topic: 6037 Message: 6059

Hi Bob...

Good news and bad news.

I reseated the microprocessor chip and put the RCU back together.

Started the amp, and it made the countdown to 000 without the "Microprocessor Conflict" error.

However, when it reached 000 it did not do the "roger beep", did not set the servos, and the buttons on the RCU were non-responsive.

Powered off and back on, and then got the "Microprocessor Conflict". Powered off and on again and the amplifier went thru normal start-up and gave "roger beep" at 000 and would switch into "operate" mode, appeared working properly.

I need to power cycle it some more but am nervous about the intermittent behavior it's showing.

Any further words of advice?

Thanks and 73

6061. Re: [acom-list] ACOM 2000A Microprocessor Conflict

Yahoo group: acom-list (2010 — 2016)
Date: 2014-10-02 16:27:44 UTC
From: K0DAN
Topic: 6037 Message: 6061

At first it was intermittent during power cycles. I have since done about a dozen power start-ups and it now seems to be working properly. I'm a little nervous that it was at first still getting "Microprocessor Conflict" and mysteriously stopped, but I have since done about a dozen power start-ups and it now seems to be working properly.

Thanks for your assistance!

6062. Blower whine

Yahoo group: acom-list (2010 — 2016)
Date: 2014-10-08 04:52:22 UTC
From: Bill Turner
Topic: 6062 Message: 6062

My 2000A has developed a moderately loud whine from the blower. It comes and goes with changes in line voltage like when I go from TX to RX and vice versa. This is a high pitched tone, not the usual air noise.

Has anybody had this or better yet, found a fix for it?

Thanks in advance,

73, Bill W6WRT

6063. RE: [acom-list] Blower whine

Yahoo group: acom-list (2010 — 2016)

I don't have changing pitch in the blower fan when I switch from XMIT to RX.

I installed AWG 8 wiring to my 2000A from the 20A breakers in the A/C panel (240V, single PH service) to protect against the problem you describe.

I don't know if this is your problem or not, but it may be something to check.

73,

Bill, N3RR

GM Bill -

Depending on the age of your 2000A it will have one of three different blower configurations that have been used over the years.
The original blower was made by Bomax - the same blower used in Alphas of that era. Anyone with either an ACOM or Alpha with a Bomax blower is running on borrowed time. They eventually wind up creating one version or another of bearing noise. It can be temperature sensitive, line voltage sensitive etc. Mine used to get noisy about 20 minutes after power on.

There is no direct replacement for the 120 VAC Bomax blower. Instead, ACOM went to a 24VDC (or is it 12VDC?) blower and a different bracket to fit it in. The swap out is very simple. New 2000As have the new blower directly wired in. For Bomax replacement however, ACOM came up with a slightly different configuration: The new blower and bracket, with a small 120VAC to 24VDC power supply attached to the back. This make the retrofit easy - as an "assembly" it hooks to the existing 120 VAC wiring.

I'd contact ACOM/Array Solutions for a new blower --

I should have mentioned my 2000A is less than two months old.

Pretty sure this is not bearing noise.

From: ki4d@...
Topic: 6067 Message: 6067

Anyone have any idea what comes next when an ACOM2000A shuts down operation with an error message showing filament voltage high 5.5 voltage? That happened with mine last Sunday. Any ideas or help would be most appreciated.

Don, KI4D

From: Brian
Topic: 6067 Message: 6068

Do you mean low?

Low voltage used to occur in earlier 2000's due to burning and corrosion
in the connectors running filament voltage to the PCB's.

Hi Brian, thanks for asking.

To help clarify and provide a little more info, the red protect light lights up on the control head, and the LCD message is "+5V TOO HIGH: 5.5V." I am thinking I might need tube replacement but that is only a hunch.

I especially welcome comments from anyone who has seen this condition. I don't want to have to ship the amp unless absolutely necessary.

Given that Bill's amp is a "low hours" amp, one would not expect such early fan motor bearing failure.

It might be good to make sure everything is powered down and discharged first--and then it would be good to open up the amp enough to make sure some foreign debris was not sucked into the fan, thereby causing noise generated by the fan-blade contact. Just another thought.....

Constructively submitted,

Jerry K7VIT

PS I have a 2-fan ACOM 1000 whose 2 fans running are quieter than my XCVR's 1 fan cycling when running less than 1/2 power. <Grins>

I will do what you suggest, but this seems more like a sympathetic vibration than anything else. As I mentioned, it comes and goes with a small change in line voltage like going from RX to TX and vice versa. Also, if I use my finger and stop the external fan, the noise stops but my gut feeling is it's not the fan itself, but something else like a pressure change inside.

By the way, how should that external fan be mounted? I mounted it blowing air in, but it could be mounted sucking air out. There were no instructions that came with it.

Right now it's perfectly quiet, TX or RX. I think it knows I'm writing this email about it. :-)

Again, I am operating with an ACOM 1000, little brother to your amp.

My optional 2nd fan draws air from outside in the back to force it through the power supply and over the power XFMR. The air continues to the RF deck, through the standard equipment 1st fan, to the tube base, up through the tube fins, and out of the amp. I am very impressed with the design, and I very much appreciate the temperature sensor and readout.

One would not want the 2 fans fighting each other for cooling air. Make sure they are installed to help each other.

Bill, I believe you have some good observations, but I wanted to point out one more option. Of course, there is always the possibility of a loose filter or fan guard/shield which could vibrate sympathetically. That's another thought: loose hardware somewhere nearby.

Good luck with the whine.

6074. Re: Blower whine

Yahoo group: acom-list (2010 — 2016)
Date: 2014-10-09 19:27:32 UTC
From: Eric Fowler
Topic: 6062 Message: 6074

I recently purchased a 2000A with the external fan option. I experienced what I thought sounded like a mild transformer hum, until I noticed the hum "spun down" when I shut the amp off. Upon speaking with Bob over at Array Solutions, we determined it was the external fan. Old firmware versions used to keep the fan off until it was needed, the latest has it running whenever the amp is turned on by the RCU. Since I usually don't run continuous duty modes, Bob suggested adding a switch in line with the fan. My solution was to drill a small hole and mount a mini toggle switch below the fan wire grommet.

Now the amp is nearly silent, with only a slight swoosh of air from the squirrel cage that cools the tubes. If I need the external fan, I reach behind and switch it on.

Interesting. Maybe it is my external fan. I noticed that if I remove
the filter and filter bracket the noise stops. For now I'm going to
run it that way.

And yes, I will also be sure to dust out the chassis more often.

Bill,

I'm not familiar with the ACOM 2000 ... perhaps Jay WX0B can chime in on this. The metal filter and other metal components may provide needed shielding which should prevent RF leakage from the amplifier enclosure.

If one or more components are vibrating, it or they can probably be vibration damped to stop that unruly whine. We want them vibration insulated but NOT electrically insulated.

The fan is indeed a Pabst fan, and can be installed with hand tools. Make sure you order a new filter for the fan if you buy one from Mouser, or other electronics distributor.

Now the important part. Believe it or not..... We have had 2 Acom 2000A amplifiers sent to us recently that had the fans installed backwards. So the external fan was fighting the internal blower. Make sure your fan is installed to blow air into the amp.

Due to more dust now able to get into your amp keep inspecting the air filter and clean it. And take the cover off the amp once in a while and do the same.

The Acom 1000 also uses a smaller Pabst fan.

Now doing more RTTY and occasional JT65 (6m eme) so I'm planning to
install the external fan on my Acom 1000. I have the correct size fan
but at present unable to source a snap on filter kit. I'm wondering if
the existing metal mesh filter might be too obstructive and reduce the
effectiveness of the fan. I do have a wire finger guard as illustrated
in the 1000 manual.

Presumably the fan wires enter the chassis through the plastic bung top
centre above the filter.

Regards,

Mike VP8NO

The fan fits directly where the existing air inlet filter is on the rear panel. The fan I have is a 92 X 92 25mm 24Vdc 45cu.ft/min Sunon Maglev KDE2409PTV2 13.MS.A.GN. It It was supplied by the Acom importer in the UK, Vine.

I have the concentric circle finger guard for the outside. I doubt that there is any RF screening issue given that the rf circuitry is in a fully screened section of the amp. There is quite a bit of field strength immediately above the tube air exhaust chimney. Though I can't remember the figure it was well below the the exposure safety limits.

Recently when running the amp in JT65A at 900W during a 36 minute QSO the max chimney temp was 73C and the main blower never speeded up. The idea is to get a bit more cooling air around the PSU section components as recommended by Acom for long full power constant carrier transmissions.

A bit more noise, no doubt, I believe that vibration isolation mounts are available if necessary. Heat is no friend to electronics.

I assume Array Solutions supply/fit accessory fans. Jay might well have some input on this.

Not surprising. When an amp is tuned for max output and efficiency at
a high power level and then the drive is reduced, you are actually
going from class AB mode into class A mode, depending on the amount of
drive. Class A is the least efficient mode and efficiency will
decrease.

my measurements the air temp will be higher at 500W than it is at 900W.

60C is cruising, I see that all the time running a pile up in RTTY for

an hour or so at 600W. My aim is to increase the cooling of the

PSU/control components.

Regards,

Mike VP8NO

Thanks Mike
yes you're correct
the 1000 runs cooler and is more efficient with higher powers out.
With digital modes like JT65 and JT9 it is most important to have zero alc for a clean transmission.
I've disconnected my external fan as there is too much wind noise!
73

I'm watching my amps here during CQWW SSB run up to 90-100 centigrade but not hearing them kick into high speed. Also have the AUX fan installed which doesn't seem to kick into higher speed either.

Ideas? Thoughts?

Thanks...Rich

REPLY:

On my 2000A the fan power comes from a pair of holes on a small PCB inside the unit. You do have to take the cover off and you have to remove the transformer too. You could of course, wire it to an external supply such as a wall transformer, also known as a wall wart. When installing the fan, make sure it blows air INTO the amp, mot vice versa. Murphy is watching.

One caution with doing it that way: The fan speed (i.e. voltage) MIGHT be controlled internally based on temperature. Without a schematic I can't tell. Might be wise to verify this before using a wall wart.

6098. ACOM 2000A and Elecraft K3

Yahoo group: acom-list (2010 — 2016)
Date: 2014-10-27 19:13:16 UTC
From: Bill Turner
Topic: 6098 Message: 6098

I think I have figured out the connection issues when using a K3 with an ACOM 2000A. I wrote up the following mini-tutorial to try to clarify what is, to me, a confusing situation.

Please read it and let me know if I have made any errors and whether you find it helpful.

If you find it helpful, feel free to copy and distribute any way you wish.

Thank you,

73, Bill W6WRT

++

When operating an ACOM 2000A with an Elecraft K3, there are two possible modes of frequency control. Each mode requires a different cable.

When a PC is NOT connected:

Use a cable like that shown in figure 7.6 of the ACOM 2000A manual. You should set the K3 AUTOINF menu option to "1". In this mode the 2000A will poll the K3 for band data and will change bands accordingly. The K3 will also send band data when you manually change bands on the K3.

When a PC IS connected:

Use the cable shown in figure 7.2 in the 2000A manual. You should set the K3 AUTOINF menu option to "nor". Note that this cable does NOT have the TXD wire going to the ACOM 2000A, but it does have the TXD wire running between the legs of the Y connector. This cable can be either a single cable terminating in two DB-9 connectors or it can be a single cable with a "Y" adaptor connected at the DB-9 end. In either case, it must be the electrical equivalent of figure 7.2. In this mode, the ACOM 2000A gets band data information ONLY from the logging program, not from the K3. If you close the logging program, the ACOM 2000A will NOT follow band changes from the K3. You can still do band changes by sending a "dit" as explained in the ACOM 2000A manual.

I can confirm that, the remoterig RC1216H is the only way to have a reliable and stable control over the ACOM2000, configure it once and never touch it again. Running 3 of them at remote locations and never had any troubles with them. They even give you a readout of all the voltages, temperatures and currents of the pa and you can switch the antennas, when using the Acom-Antenna switch. By far the best remote-control for the ACOM2000 you can find on the market.
And if you sell your ACOM one sad day and going qrp, you can use it as a controller for your antenna rotator or your stepIr-beam, expert or elecraft-amplifier .

This weekend is the daylight savings time change.
Here is a list of things you need to do:

1. clean your ACOM air filter.
2. Replace your smoke detector batteries.
3. Time the minute hand on your watch to verify accuracy.

With the contest season upon us and you'll be running all knobs to the right,
it's important that your ACOM air filter is clean for maximum air flow and cooling.

Dear Vikas

Greetings from Dubai

For the TS590 you need a 7 pin DIN plug (manual page 66)

For the Acom 1000 you need a phono plug for the "key on" jack on the back.

Connect pin 4 of the DIN to the "live" of the phono and the screen of the phono to pin 2 pf the DIN

Best to use some sort of screened cable, audio cable is OK or cheap coax (RG59) if you cant find audio cable

Do you have Carrefour in Qatar? Here I can buy a very cheap 3 way screened phono to phono lead (red, white, yellow) used to connect TV to DVD player etc

Split the cable if the 3 cables are moulded together and use one. Cut off one end and solder to the DIN

That eBay cable should work fine. The short version of your directions:

Hook up the 590’s antenna connector to the ACOM RF In and your antenna to the ACOM RF Out. I’m assuming your antenna is less than 3:1 SWR or you will need a tuner.

Hook up the keying cable to the 590 and the ACOM Key In.

Set menu item 53 on the 590 to 2.

The longer version is at http://homepage.ntlworld.com/wadei/ts-590s.htm <http://homepage.ntlworld.com/wadei/ts-590s.htm> and go to Common, Amplifiers, ACOM 1000.

I like my ACOM 1000 very mucn and I think you will enjoy yours.

73,

Jim, W4SDJ

Thanx Jim,

I'll start plumbing it in tomorrow. I'll have to read up on menu 53, currently set = 3 for AL-80A and LK500 amps but one of those is going over to be dedicated to the ol' TS-830S (Need the ALC feedback for it) on a separate leg before the antenna switch. UPDATE: Just read the menu 53 info... makes sense as I'd assume the A-1000 can switch faster than either of the ol' gals.

The dipole is good on phone w/o tuner. The hex is good on digital w/o tuner but both legs will have a tuner plumbed in.

Also swapping in a 'B43' 590 and sending my 'B35' off to Kenwood in a couple weeks. Might sell off the B35 and if timing works out have it sent by Kenwood straight to new owner.

Thanx for clarifying... forgot about the common amps section.

Asunto: FW: [acom-list] 2000A Low G1 Bias failure

Hello Jaime

I had a similar problem three years ago. Mine turned out to be a bad C2 capacitor, as discussed the my e-mail correspondence with Array Solutions, the U.S. distributor. I just tacked a new capacitor at JP3:1 to ground as shown in the attached photo. I have attached the photo that they sent to me. Just make sure that the "+" terminal of the capacitor goes to ground. My amplifier has worked flawlessly since.

Sent: Friday, March 18, 2011 10:08 AM
To: acom-list@yahoogroups.com
Subject: [acom-list] 2000A Low G1 Bias failure

Sam,
I sent your request for help to ACOM in Bulgaria.
Here is their response:

-110 V for BIAS is low, it should be between -120 -130 V. This voltage can be measured on
JP3:1 board interface and with only mains switch turned on. It is possible that capacitor
C2-47mF/200 V on board LV has dried up. It is necessary for test to connect a capacitor
47mF/200 V between JP3:1 board interface (see photo); (-) must be on JP3:1

and (+) on GND.
It is good to check for good working order all elements participating in making up this voltage,
See LOW VOLTAGE SUPPLY Sht.1 of 4.

If all elements mentioned above are OK and the tubes are in good working order then you have to
Check the elements of the circuit for regulation if the initial plate current of the tubes. See
INTERFACE Sht. 4 of 9.

I have seen this many times. It has always been a tube. Internal DC
grid resistance is a very common failure mode for the Svet 4CX800A. I
would check the tubes by replacement before I headed to the LV board.

Buenos dias, Jaime!

If it is the capacitor, you will probably know as soon as you look at it. I had this problem several years ago. The capacitor was burned badly.

If you need a replacement capacitor, I have one and I will gladly send it to you - no cost to you. I bought extras, so I am happy to help my friends who need them.

Jaime,

I am trying to find the procedure where you open up the front panel, remove a plug and test for the Bias Voltage with the tubes installed. This will tell you if it is the cap or a tube.

If it is the cap and this is an older 2000A you may want to consider replacing the other electrolytic caps too. I had a few caps there were marginal after several years. Not expensive at places like Digi-Key.

73,

N2TK, Tony

Asunto: FW: [acom-list] 2000A Low G1 Bias failure

Hello Jaime

I had a similar problem three years ago. Mine turned out to be a bad C2 capacitor, as discussed the my e-mail correspondence with Array Solutions, the U.S. distributor. I just tacked a new capacitor at JP3:1 to ground as shown in the attached photo. I have attached the photo that they sent to me. Just make sure that the "+" terminal of the capacitor goes to ground. My amplifier has worked flawlessly since.

Subject: [acom-list] 2000A Low G1 Bias failure

Sam,
I sent your request for help to ACOM in Bulgaria.
Here is their response:

-110 V for BIAS is low, it should be between -120 -130 V. This voltage can be measured on
JP3:1 board interface and with only mains switch turned on. It is possible that capacitor
C2-47mF/200 V on board LV has dried up. It is necessary for test to connect a capacitor
47mF/200 V between JP3:1 board interface (see photo); (-) must be on JP3:1 and (+) on GND.
It is good to check for good working order all elements participating in making up this voltage,
See LOW VOLTAGE SUPPLY Sht.1 of 4.

If all elements mentioned above are OK and the tubes are in good working order then you have to
Check the elements of the circuit for regulation if the initial plate current of the tubes. See
INTERFACE Sht. 4 of 9.

Thanks Glen for your offer, I have to look at the local electronics shop, I think they have capacitors 47uF/300V only but I have to look at them size, etc.
The fault I have is not "Low G1 Bias Failure" it is "Bias too low at startup".
Thanks Tony but Val sent me all info, I have measured the voltage at JP3-1 at the front panel and is low 98V, the capacitors may be dry. I have to take out the LV board not and easy job and test them.
I will let you know then. My Acom is an old one from 1992 but only 2000h use.

I have to find the time and mood to repair it, my dear wife just died from a brain stroke at 60y old 7 days ago after terrible month at hospital and I am still shock.

Jaime,
I´m also thinking in a tube failure. I replaced both tubes on mine with over 2.300 hours on it. I got the same message ¨Bias too low at startup¨...Firstly, it happened one or three times but
I restarted the amplifier and everything was back to normal. The fourth time it did occur, the amplfier shut down automatically and wasn´t able to put it back on...
BTW: I´m sorry about your wife´s death....

En español:
Jaime,
seguro que son las válvulas como te han dicho. A mi me ocurrió lo mismo con unas 2.300 horas y me salía el mismo mensaje que a ti. Al principio me pasó una o tres veces, lo reseteaba y comenzaba la secuencia de arranque. Todo perfecto. Pero a la cuarta ya no volvió a arrancar más...Cambié las válvulas y todo ok hasta hoy (toco madera).
P.D: Siento mucho lo de tu esposa.

Well after replacing the tubes for new ones still the same fault "Bias Too Low at Power ON...-80V"
I have taken away the HV Transformer and the other two boards HV and Filter board.
Just looking at the capacitor C2 looks normal not any bubbles on it, to check it well it has to be unsoldered but first I have to find any 47uF to substitute.
I don't know if I would be able to put it all back again, this LV board it is not an easy job. Maybe at the end I will have to send it to Acom Bulgary to repair.
73,
Jaime, EA6NB.

With the help of Val from Acom now the amp is OK, It was a bad capacitor, C2 in the Low Voltage Board, it was a hard job to take this board apart, good about Acom they use most components easy to find, I've got the cap yesterday (under a heavy rain) in the local TV-Radio parts shop at Palma, 47uF/350V.
I have put back my old tubes (2000h use in 15 years most in stby) before I use my old new spare tubes so I know I have a new pair when needed.
Thanks to all for the help.

Date: 2014-11-13 19:22:16 UTC
From: E.P
Topic: 6130 Message: 6130

hi
replace new tube
Trying to tune it, the ATT light comes on and the automatic attenuator operates. I centre the TRI, peak the output and then I go back to standby. I transmit again without touching the controls. The TRI is not at the centre any more, but goes to the extreme right of the display. Trying to centre the TRI with the load control results in the ATT coming on again. Further attempts to tune the amplifier result in the same behaviour and it can never be tuned normally.

I have tried another spare tube, rebiasing the amplifier, and also tried the original amplfier tube, and each time there is exactly this odd behaviour.
Do you have any suggestions what may be wrong please ?
thank you
Elan

My Acom 1000 has been running daily now, a few hours a day, for 3 or 4 weeks now. This includes some time being Net Control on a couple 20m RTTY nets that really runs an amp hard.

It's been flawless and has balked when it should have (antenna issue, high reflected) and has just run when it should have. Thanks to everyone who helped me with all my questions prior to taking the ACOM plunge. I'm a VERY happy camper.

Now a new line of questions...

I've never had it WARN or kick off due to excess temps but does anyone have any guidelines on what the MAX Exhaust Air temp should be before I hurt stuff?

Running a 20m RTTY WAS net last weekend and on one long script being sent I hit 201F. This was higher than I've seen before and WAY higher than it ever gets on SSB. I do not have the optional fan but if I'm gonna keep running these RTTY nets then I probably should pick one up.

Is there some temp of something where it kicks a warning or faults to save itself from me?

Skip

From the protection parameters of the acom1000
at 266 F warning message on screen
302 F from transmitting to stand by
329 F shut down

In rtty a gu74b tube runs happy at 750 W, other parts in the amp will be happy to such as the transformer.
the optional extra fan is more an extra cooling for the power supply section than for the tube.

Hi

My Acom 1000 was miss switched on the band switch and it was set between 80m and 160m then power applied to tune, it has taken out the wiper on the rear most wafer .. the wafer that switches additional capacitance for the lower bands.

Is this wafer available .. OR are the contacts and wiper available as parts ???

the ceramics are all ok

Jim M0CKE

Date: 2014-12-03 19:44:59 UTC
From: Walt
Topic: 6140 Message: 6140

Howdy,

Let me introduce myself. My name is Walt and my call is K2WK. I'm an avid contester, dx'er and have been licensed since '66. Anyone remember CD parties? That's how old I am :-) I'm new to the group and I'd like to say hello to y'all. I just received an Acom 2000a day before last and would like to pick your collective minds about some issues that have developed.

If any group member who owns an Acom 2000a might be able to help me I'd greatly appreciate it. As a novice with regards this fine amp, I have a number (not a lot) of fundamental questions. Your time, help and advice would be greatly appreciated and I'll name you in my will :-)

I am seeing a progressively worse SWR on the input to the amp as the operating frequency goes higher. Let me explain: on 1.8 MHz , 3.5 MHz & 7.0 MHz the SWR is Okay, below 1.5:1. However, on 10.0 MHz to 28.0 MHz the SWR is over 2:1 and is as high as 2.5:1. Has any one experienced this problem? This is my second new 2000a (the other one may have been damaged in shipping) had the exact same problem. Bad production run? A broken 50 ohm swamping resistor? The latter was suggested by the vendor. Not sure what's going on, and thought I'd ask the group. Funny, but this is now starting to look like a pattern. Any advice?

73 de Walt - K2WK

Do you have an antenna analyzer you can connect to the input of the amp?
Let's get the radio out of the picture and see if an independent device
measures the same SWR.

I had a 2000A for a few years back in 2000 and loved it - very sorry I sold
it, but had to for financial reasons.

Howdy,

Let me introduce myself. My name is Walt and my call is K2WK. I'm an avid contester, dx'er and have been licensed since '66. Anyone remember CD parties? That's how old I am J I'm new to the group and I'd like to say hello to y'all. I just received an Acom 2000a day before last and would like to pick your collective minds about some issues that have developed.

If any group member who owns an Acom 2000a might be able to help me I'd greatly appreciate it. As a novice with regards this fine amp, I have a number (not a lot) of fundamental questions. Your time, help and advice would be greatly appreciated and I'll name you in my will J

I am seeing a progressively worse SWR on the input to the amp as the operating frequency goes higher. Let me explain: on 1.8 MHz , 3.5 MHz & 7.0 MHz the SWR is Okay, below 1.5:1. However, on 10.0 MHz to 28.0 MHz the SWR is over 2:1 and is as high as 2.5:1. Has any one experienced this problem? This is my second new 2000a (the other one may have been damaged in shipping) had the exact same problem. Bad production run? A broken 50 ohm swamping resistor? The latter was suggested by the vendor. Not sure what's going on, and thought I'd ask the group. Funny, but this is now starting to look like a pattern. Any advice?

Hi Brian,

Thanx for the almost instantaneous reply. I'm going to change the length of the coax between the rig (Pro III) and the amp. If I get the same results I'll put the RF analyst on it as you suggest. That may just tell us what's going on. I'll keep you up to date, especially if I find a solution.

Hey Bill,

Thanx for the almost instantaneous reply. Yes, it was good to see you at the dinner, just wish I had sat by you. It looked like you were quite busy with treasurer stuff :-)

I'm going to change the length of the coax from the rig (Pro III) to the amp. I remember it was critical on the 87a, had to be 10', I think. This is truly weird. One guy suggested I use an RF analyst to see if I get comparable results. I believe my coaxial dynamics wattmeter.

I'll give you a jingle this evening and I can fill you in on the details.

Hi Walt,

A fact and a few guesses:
I have a pair of 2000As here and the SWR is 1:1 on every band as seen by the exciters. The 2000A has a well designed input network, you should not see SWR anywhere near what you are seeing.

- I would check the jumper between the rig and the amp. Are you SURE it is not 75 ohm coax? Is in good quality - including properly soldered PJ-259s and never having had water damage? You might try a swap out. Even if you swap it out with a 20 or 30 foot good piece of coax - that's just fine.
- Are you using band pass filters between the rig and the amp? It you are, you are measuring the SWR of the BPFs, not the amp. These are notorious for not being 1:1 and they shift with band to band and within a band. Try running without them as an experiment. These can throw the SWR readings all over the place. The same goes for a low pass filter for TVI help and for a 1:1 "isolation/decoupling" transformer. Take out everything between the rig and the amp for testing. Antenna switches too. Test with just one piece of GOOD 50 ohm coax.
- Do you have the antenna tuner in the rig turned on. It should be OFF! This can create oddly measured SWR behavior. Likewise, an antenna tuner between the rig and the amp may cause problems. Even in "straight through" they add some impedance. Take it out as a test.
- If the amp is otherwise okay - (a good test is to get about 1500W for 50-55 watts in) then the amp tubes are probably fine. But they could be going bad. I have seen bad tubes, but I have not however, seen them change the input impedance of the amp. A shorted tube could however and grid shorts on 4CX800s are the single most common tube failure.
- If all else fails, I would make the following inspection: Turn the amp upside down with the top cover still on. Remove the access plate under tubes sockets - its easy. There was a very large 50 ohm resistor in there which sets the input impedance via swamping. It is the same in the Alpha 99. The mounting hardware on the resistor is sometimes loose. More likely, you do not have that resistor. It was changed out at a very early serial number to a surface mounted 50 ohm high power block mounted to the chassis. Look over the input network wiring and parts. This is a very easy area to inspect.
- In standby and with the amp on a 50 ohm dummy load, what do you see? You should see 1:1.

If you need more help, what is the serial number of the amp?

Good luck - I'll help further if I can.

After helping folks I often get offers of this and that. My answer is always the same - pay it forward. Help someone else in this hobby....

Hal

REPLY:

The length of coax does not affect SWR except for very long lengths.

If the SWR is something other than 1:1 it does affect the impedance
that the transceiver sees, but it does not affect SWR.

Are you sure your SWR meter is accurate? Have you tried it into a
dummy load?

Hello to all that helped me solve the Acom 2000a high input SWR problem.

Many thanx for all the informative replies. Man, I got quite an education on the amplifier. It seems that Acom has quite a following of 1st class hams.

Before Anyone Goes Any Further: STOP

I believe the problem has been solved. It was the stinking coax to the amp.

Hi, Walt et al. Great! Glad you found 'the problem.' But please be careful! It MAY NOT be the coax!

I have the 2000A, newer than my A-1000, and other than a tube issue, have not really had any difficulty. The tube issue was vexing enough, and had I listened to Jay early on, I'd have slipped the new tubes in and that would have been the end of it.

HOWEVER, I have an intermittent condition with the A-1000. The presenting issue leads one to believe that a coax jumper connected to the amp input is 'bad.' You can tell by jiggling the coax and watching the effects! But replacing the 'bad' coax with a new coax jumper provides only a temporary solution. Soon enough the fault comes back, and again jiggling the coax seems to 'fix' the problem.

THEN I figured out, after replacing several coax jumpers, that the problem is not the COAX, but it is the coax connector on the back plane of the amp. I guess the coax has been screwed in and taken off enough times, with perhaps a little strain on the coax, that the fingers that hold the center pin of the PL-259 make intermittent contact. The fault occurs randomly when the amp is powered. Thankfully the protection circuits are beefy enough to prevent (much/any noticeable) damage -- but one doesn't like to have the amp fault just as one calls the ATNO that suddenly appears. I have to look into replacing that SO-239 on the A-1000 backplane. I HOPE that will be an easy job (because I don't like to stress my friends upon whom I depend too much! hi hi). Truth!

In the meantime, the 2000A is doing just fine, thank you.

So, maybe you had a bad piece of coax and maybe you didn't! Only you can/will know for sure! I hope you've totally solved your problem, Walt, because we can hear your anguished cries all the way down here at Virginia Beach! Good luck, Dude. Vic, W4VIC

I have never paid any attention to the SWR between transceiver and the 2000. My attitude is, as long as it works fine, I don't care73 Rag la5he

Den Onsdag, 3. desember 2014 20.45 skrev "'Walt' k2waltk@gmail.com [acom-list]" <acom-list@yahoogroups.com>:

Howdy, Letme introduce myself. My name isWalt and my call is K2WK. I'm anavid contester, dx'er and have been licensed since '66. Anyone remember CD parties? That's howold I am J I'm new to the group and I'd liketo say hello to y'all. I justreceived an Acom 2000a day before last and would like to pick your collectiveminds about some issues that have developed. If anygroup member who owns an Acom 2000a might be able to help me I'd greatlyappreciate it. As a novice with regards this fine amp, Ihave a number (not a lot) of fundamental questions. Your time, help and advice would begreatly appreciated and I'll name you in my will J Iam seeing a progressively worse SWR on the input to the amp as the operatingfrequency goes higher. Let meexplain: on 1.8 MHz , 3.5 MHz &7.0 MHz the SWR is Okay, below 1.5:1. However, on 10.0 MHz to 28.0 MHz the SWR is over 2:1 and is as high as 2.5:1. Has any one experienced thisproblem? This is my second new2000a (the other one may have been damaged in shipping) had the exact sameproblem. Bad production run? A broken 50 ohm swamping resistor? The latter was suggested by the vendor. Not sure what's going on, and thought I'dask the group. Funny, but this isnow starting to look like a pattern. Any advice? 73de Walt - K2WK

Hello Callum,

I have exactly the same wish: swapping out the SO239 with N-type connectors. Perhaps we can help each other with exchanging information about how to do this. The input (TRX) connector is not very difficult to do, but the output (ANT) connector is a different story. Has someone in this group already did this job?

Tnx and 73, Hans.

Thank you, Callum. Yes, that's one solution. But I switch cables between the A-1000 and the 2000-A. Bulking up the center pin may be a good solution for the 1K but I don't want to compromise the connections on the 2K! I think I can find an adapter for the 1K and can fix that up so that it will work. Or, as was suggested, perhaps swapping out the Input connector is not so bad a job. I'll go with KISS principle as long as it works! hi hi

Do you really think the N-type connectors would be an improvement? How so? I have found them to be less sturdy and they sometimes lose their grip on the coax itself -- especially if not very well strain relieved.

Thanks for taking the trouble to respond. Vy 73, es good luck with your 2K. Vic, W4VIC

I recommend you (anyone) watch Frank' s, (W3LPL) recent couple years' of Contest University presentations where he talks about Type N vs PL-259 connectors for Amateur Radio use.

I have watched it several times in the past three years and am now in the process of replacing all the Type-N connectors in my station. I've now replaced all of them on my towers, but I have many more to go, including the

Polyphasers change-out to have UHF/UHF instead of N/N connectors at the base of both towers.

Hans,

First of all, I am saying we should replace our N connectors with PL-259.

Sorry if I confused you or anyone else with my posting.

Pl-259 connectors are also called UHF connectors here in the US.

That may have caused the confusion.

Frank is on the faculty of Contest University and brings this subject up in more than one of his sessions.

One of the presentations where Frank mentions the problems with Type N connectors is

posted on the Contest University website.

Go to: ContestUniversity [dot][com]

Click on the "Videos" tab.

Then click on the link in the third bullet under the "Dayton 2013 Contest University".

"Contest University III: Design, Installation, and Maintenance of Antennas by Frank Donovan, W3LPL"

In that presentation, at time stamp 48:25, in the Q&A segment of that presentation, "Todd" asks

two questions. (The questions are not recorded, but Frank's answers are recorded.) The second question asked by "Todd" is about N connectors.

That is where Frank takes 4 minutes to enlighten everyone to why hams should not use type N connectors on HF.

I designed my station in 1991 - 1992. The best practices then was to use Type-N connectors.

I had 86 type-N connectors in my antenna cabling network design from the shack to the antennas.

I've now replaced 10 Type-N with PL-259 connectors. I only have 76 more Type-N connectors to replace!

Plus, I need to buy new Polyphaser lightning protectors with SO-239 connectors

and discard my Polyphasers with Type -N connectors.

You can see several photos of my antenna cabling system and read about my station design on my website.

users [dot] erols [dot] com [slash] n3rr

Go to the design links near the bottom of my homepage.

73,

Bill, N3RR

Thanks Bill.

W3LPL is talking about N-connectors, who are not correctly mounted; when the pin of the male connector is not in the correct position. In this case things could go wrong. He is right and I agree with him! This is the reason why I always mount N-connectors in the right way and use N-connectors from brands like Suhner, Rosenberger, Radiall or Greenpar. I avoid Chinese Export.

* The pin of the N-connector is double shielded. The pin of the PL-259 is not. Same with the SO-239.
* The impedance of N-connector is more stable 50 Ohm than a lot of PL-259/SO-239 connectors on the market. Measurements with PL-259/SO-239 in some cases showed an impedance of 35 Ohm, instead of 50 Ohm.
* N-connectors are more resistant against dust and moisture than PL-259/SO-239.
* N-connectors have a much higher frequency range than PL-259/SO-239; N-connectors can be used until at least 11.000 MHz, while PL-259/SO-239 claim 0-300 MHz.

Just my humble opinion...

73, Hans.

Hi

Did you already get Technical Supplement CD?
I got RS-232 protocol info from Acom by email.
I can send it to you.

While you are at it, please look into crimp-type UHF connectors.
Below is a brief article I wrote on using them. I hope it will be
helpful.

++

I love crimp type coax connectors. Done right, they are faster and
more reliable than solder type. I will never go back.

First, there are two types of crimp connectors. They both are designed
to have the braid crimped, but some of them are designed to have the
center pin soldered. Do not mix up the two kinds. The solder type has
a small cutout for the solder like PL-259's have had forever. The
crimp type has a round pin with no cutout. DO NOT try to crimp the
solder type and do not try to solder the crimp type. It won't hold.
Guess how I know. :-)

Always crimp or solder the pin first and then give it a good pull
before you crimp the braid. It should not pull out, obviously. How
much pull? I don't know exactly, but i think it should withstand at
least ten pounds or so. More is better.

In order to get a god crimp on the braid of the coax, all the braid
wires must all be intact. In other words, if you nick a few strands
and remove them, the crimp will not be as tight as it should be.
Do it over.

In order to get a really tight crimp, I like to put a single wrap of
electrical tape over the braid first. The ferrule is not part of the
electrical connection, so don't worry about that. it's only purpose it
to press the braid tightly to the connector. The tape just enlarges
the diameter and increases the pressure applied by the ferrule. You
could instead use heat shrink tubing of the appropriate size.

I highly recommend using a coax cutting tool, the kind that makes two
cuts at once - one down to the center conductor and one down to the
braid. It is well worth your time to get the depth of cur just right.
These cutters are adjustable so practice on a piece of coax and figure
wasting a foot or two until you have the cut perfect. You will be well
rewarded in the long run.

Hope this saves someone some grief. Comments welcome.

From: Jim Lawrence
Topic: 6167 Message: 6167

When I turn on my ACOM 2000A I am getting a protection fault. Occasionally, the AMP faults instantaneously after the power on sequence completes. I can't see the fault message it flashes pass to quickly. At other times when I get thru the power on sequence I get a Bias to low fault. The bias say its zero volt.

So a couple of questions.

How do I dig out the fault message when the amplifier turns itself off instantaneously after the completion of the power on sequence of 150 seconds?

What is the cause of the bias too low? Is it tubes? Or a power supply? Are there any known recurring causes of the a bias to low problem?

How/where do I get a service manual?

The amplifier is ten years old and has a had a hard life contesting for long periods at a time. Eventually, I can get the amplifier on after repeated power on attempts. It then seems to operate normally for as long as I keep it on. If I turn off amplifier and turn it back on within a few minutes it will continue to operate normally. If I turn the amp of and let it get "cold." I then have the problems described above.

The first attempt to power it on results in an instantaneous power off. The second attempt results in a bias to low fault. subsequent attempts at power on usually result in the amp operating normally.

I need some ideas/info as to cause of my problem with the amp.

Jim,

I had the same problem.It was a bad tube.
A filter cap in the bias supply is also known to go bad.

I sent my amp to Array solutions. They replaced the tubes and the filter cap (which was still OK).

Great, FAST service.
Call Jay or Bob. They will take care of you if you do not want to do it yourself. A bit of a pain...

Hello,
I had this fault about one month ago, it could be a bad tube or a bad C2 electrolytic capacitor at the LV Supply board (not easy to get there). I had a bad cap, I replaced after a 2H job and the amp (15 years old but easy life) was working again, still with the old tubes.

The worst was to take down the heavy amp from a high shelf and putting it back again!
There is a test to know if it is bad tube or a cap, removing the front panel and checking three voltages voltages with the amp switch ON.
No need of Service Manual just email Acom and Val will guide you to repair it.
73,
Jaime, EA6NB.

Folks,

Thanks for all the info and the offer of a capacitor. Right now my
biggest problem, is getting the amplifier off the shelf:-) It is much to
heavy for me lift alone.

To everyone that responded both off and on line. Thanks again.

Topic: 6140 Message: 6173

Hi Vic and the gang,

I have a big smile on my face after reading the end of your letter. Anguish yes,
but the (probable) resolution was readily at hand. Swapped the jumpers and voila, it woiky-woiky now. And after all that, man do I feel dumb. You mentioned the coax connector inside the amp becoming loose. I had the same situation with a Palstar tuner. Some form of strain relief is called for.

I'd like to thank you all with helping out. I believe in the collective wisdom of the group. Lottsa great stuff on here. BTW, ran 160 last night for hours and hours, it was fun. Life's too short for QRP :)

Hi Jim.

Hope you are doing well. Get that Acom off the shelf and keep it on a low table. You may recall that at Sig's we made two rough amplifier stands out of 3/4" plywood and 2by4s. Cheap, but very effective.

You may know that Sig has decided to do mostly single op entries from now on. We just couldn't get enough ops (that he was comfortable with) to come in and operate. So, I've moved over to WE3C, who is building a mega multi/multi station in Fleetwood. It's only about 10 minutes longer a drive for me than Sig's place. We will keep Sig's antennas going indefinitely, so he should be good.

Have a nice holidays.

Dave

Hi.

I am a new member on this group, I looked for info about my Acom 1000 and I found this group.

F4EFI Gwenael

6177. New vs Used

Yahoo group: acom-list (2010 — 2016)
Date: 2014-12-21 23:10:53 UTC
From: lkellar@...
Topic: 6177 Message: 6177

I have a chance to by a used Acom 2000a for about $4800. This unit is about 8 years old and has a older model RCU. MY question for the group is, how much difference is there in the old RCU vs New RCU in regards to operation? Any advice would be appreciated

Thanks
Lawrence

It’s good looking but performs the same functions, has a built in buffer for amp / radio and the CAT tracks the radio freq and tunes accordingly.

When the new RCU came out it was $900 I believe but at $4800 for slightly use that’s a good deal.

I would pick it up.

Date: 2014-12-22 02:30:22 UTC
From: Vic Culver
Topic: 6177 Message: 6181

Hi, Lawrence. I've been using the original RCU with the Acom 2000A and it seems to do everything I need done. The new RCU has fancy color, and as a bonus, it does track the transceiver frequency so the amp is always 'on frequency;' but the original controller lets the amp adjust itself automatically and quietly and so presents no problem to ongoing operations. I believe the cost of a new RCU seriously challenges the integrity of a $1,000 U.S. banknote, so if a snappy color display is worth that kind of pocket change, go for it.

There is absolutely no doubt that the amp is well worth having. You won't find many of those on the used market -- and for very good reason. Good luck. 73, Vic, W4VIC

From: david_salomon@...
Topic: 6177 Message: 6182

By the way, there are several software packages that will also track transceiver frequency. You don't need the new RCU to do this. There's TRX-Acom, an addon to TRX-Manager (http://www.trx-manager.com/trxacom.htm), DDUTIL (http://k5fr.com/ddutilwiki/index.php?title=Latest_Revision), and Acom Director (http://www.m0yom.co.uk/). The latter two are free.

I use TRX-Manager / TRX-Acom all the time. The transceiver tracking works perfectly. I also run a Palstar AT-AUTO autotuner. TRX-Manager manages transceiver tracking for it as well. With the AT-AUTO and 2000a automatically tracking, It's like having a 1500 watt transceiver.

Has anyone been able to get Acom Director to work under Windows 7?

I have not been able to get it to work. The file/menu top bar is missing on the program, and therefore I am unable to get into the program anywhere to set the comport to the correct port number.

At this time I am using DDUtil, which works just fine.

Hello all,

This morning I turned on my 1011 and , what a surprise!!! after heating process no power output, nothing, I measured with an external device and nothing .... The rig has power output but I don't know what is happening, no led blinking everything is as always but... no power!!! any idea??' Can anyone help me???

Thanks

6187. Acom 2000 Low Bias on Power Up

Yahoo group: acom-list (2010 — 2016)
Date: 2014-12-27 11:40:26 UTC
From: w4ax.mack@...
Topic: 6187 Message: 6187

Just one more data point for the archives here. I experienced the dreaded low bias on power up message with my Acom 2000A. After reading the posts here I decided to replace C2, Q1, and Q2. I ordered the parts and spent two hours disassembling and replacing those parts.

I became very suspicious as I replaced those parts because I have very high end test equipment and when I checked the parts they were all perfectly good.

After a quick consultation with Hal, N4GG, he suggested it was probably a bad tube. I swapped a single tube at a time until I discovered the second one was indeed defective and causing the issue.

My lesson learned, I will always try a tube swap for these types of errors before going to component level repair. The defective tube had about 200-300 hours of heater time on it. Both tubes were NOS.

73,

Mack

Mack,

The bad tube you found had you replaced it previously or is it the tube that came with the amp when it was new?

Just curious about the tube having only 200 to 300 hours filament time on it seems rather short lived. I once had an Alpha 76CA with original 8874 tubes that were at least 10 years old and still going strong.

Yes, the K.I.S. holds true.

Just one more data point for the archives here. I experienced the dreaded low bias on power up message with my Acom 2000A. After reading the posts here I decided to replace C2, Q1, and Q2. I ordered the parts and spent two hours disassembling and replacing those parts.

I became very suspicious as I replaced those parts because I have very high end test equipment and when I checked the parts they were all perfectly good.

After a quick consultation with Hal, N4GG, he suggested it was probably a bad tube. I swapped a single tube at a time until I discovered the second one was indeed defective and causing the issue.

My lesson learned, I will always try a tube swap for these types of errors before going to component level repair. The defective tube had about 200-300 hours of heater time on it. Both tubes were NOS.

Dear

If there are no alarm leds blinking on the 1011, then check the input form the transceiver. Check the swr : must be around 1:1 , if not ther could be a bad connection betwee tx and amp, or inside the amp a bad connection on the input circuit.

Do you hear cliking the relays ? the input relais ?

Rf power out from the transceiver ?

From: Mike Harris
Topic: 6190 Message: 6190

Good day,

Suddenly the display on my 1000 has gone haywire. When switching on from the rear panel switch instead of getting the ACOM 1000 notice I see a whole bunch of random rubbish.

In the past I have occasionally seen a single block illuminated on the power bar chart which remains until it is overwritten by the normal power display. If the power level doesn't reach that block it just stays illuminated until powered down.

After a few switch on cycles eventually the display became half normal. At present the lower half of the display is normal and shows all the usual parameters OK. The upper line with the power band currently has a vertical line centred on each of the usual horizontal markers.

Anyone seen anything like this?

Regards,

Mike VP8NO

Hi Mike,

I have seen some strange behaviors of the LCD screen in Acom repairs. All times re-seating the ribbon cables at both (!) ends solved the problem. I hope the same applies for you?

hello and happy holiday to all
i have Acom 1000
on the display when switch on i see 2834v it bit change sometime it go on to 2800v with out me tx at all .
now when i set to cw and press putt on the foot switch i see the high voltage going to 2340v or so
i test this with other power socket i have and monitor the main power as well i do not see it even moving 230+- with a fulk .
is any one can test this for me and let me know what you see first as main high voltage you see on the display is it stable what is the reading you see?
and when you set to FMor cw full power what you see on the Acom display when press PTT
thank you vy 73 elan

Hi Elan,

It is perfectly normal to see fluctuations from the 220v mains displayed in the high voltage readings.

I have done measurements on my mains for a week just for a test. Under no load I see +/- 4 volt difference between day and night in example. These differences are multiplied by the transformer.

6196. Healthy Tube Regime Parameters ACOM 1000

Yahoo group: acom-list (2010 — 2016)
Date: 2014-12-28 07:17:17 UTC
From: Kees - pa7two
Topic: 6196 Message: 6196

Hi OM Elan,

Please see below about normal values your amplifier should operate. The values also differ per HF band chosen to TX on. (Check below under header "Healthy Tube Regime Parameters ACOM 1000"):

Taken from some Acom technical literature:

Protection parameters ACOM 1000

1. Cooling and exhaust air temperature. On switch-on, the fan speeds

up for a moment in order to easily get started if mains voltage is

lowered. After that, the fan speed is controlled as follows:

- while in OPERATE, it speeds up when exh. air temperature increases

above 90C (194F). It slows down when temp. falls below 80C (176F).

At 130C (266F) you'll get a warning message (still operating). Above

150C (302F) it will go to STBY.

- while in STBY, fan speeds up above 100C (212F) and slows down

below 70C (158F). It will shut down above 165C (329F) but the fan

will continue running with a "still cooling tube" message, until

temp. drops below 70C (158F).

2. Reflected power above 300W: go to STBY.

3. Screen grid current above 80mA or control grid current above

10mA: go to STBY (but you can't measure the control grid current by

the RCU).

4. Plate current:

- above 700mA: warning message on the LCD;

- above 800mA for 4s: go to STBY;

- above 1.2A: immediately OFF.

5. HV below 1800V or above 3300V: OFF (Bad mains input voltage or HV

rectifier problem assumption).

6. Drive power:

- above 90W: warning message on the LCD;

- above 120W: go to STBY.

7. Power gain below 9.5dB and above 16dB: set the input attenuator (bad tuning is assumptive).

8. Arc fault: check the RF path to the antenna as well as the antenna itself for bad connections or insulation.

9. Hot Switching: check control cables to the transceiver or transceiver's RF-to-transmit request timing.

10. Low air: check whether the air inlet and exhaust openings are not obstructed, or check the blower itself.

Healthy Tube Regime Parameters ACOM 1000

During RX: +2750...2770V anode voltage; SG voltage +340V for operate and +12V for standby; Bias voltage -120V; Anode current below 1mA.

With PTT only: +2700V anode and same SG voltages; Bias voltage between -65 and -75V, set for a 70mA low-level anode idling current, depending on the tube specimen.

With PTT and very small RF drive: +2600V anode voltage, same SG voltage; Bias voltage between -45 and -60V, set for a 220mA high-level anode idling current, depending on the tube specimen.

During TX, 1000W (external wattmeter) @ 14MHz: +2380...2400V DC anode voltage, same SG voltage, and 510-520mA DC anode current. The SG current depends on the tube specimen but is usually between 10 and 20mA. The RF anode amplitude (as measured on the LCD) must be 150-200V below the measured DC anode voltage.

On higher bands, the anode current gradually increases up to 560-580mA on 52MHz and the DC anode voltage is around 2350V at the same time (provided the mains is not "soft").

The power gain on 14MHz is 12...12,5dB up to 900-950W and it

slightly decreases (-0,5dB) to 1000W. On the higher bands, the power

gain might increase to about +1dB.

When ACOM1000 is normally loaded and tuned, the screen current is

typically zero below 35-40W drive power and it begins to flow above

40W drive. Further increasing the drive, the screen current steeply

increases, saturating to about 55-60mA at a 70-75W drive level. A

current limiter is involved at this threshold.

The screen current might not appear if the plate loading resistance

is too low, thus the anode instant voltage not reaching a low-enough

value to approach the SG voltage for a higher SG current.

Elan

It is normal that there is a voltage drop under load.
the losses are :
- voltage drop in the grid, voltage goes up and down by a few volt during the day/night
- losses in your home 'grid' due to resistance in the wire, connections, ... (cupper losses)
The best is a wire of 2.5 mm ² , the losses depending on the length and other loads on the same wire.
- losses in the transformator , also cupper losses .

You can measure the voltage drop at the plug in the shack with an without load , lets say a 2kw load
You can use therefore an other load e.g. an electric heater.
You can improve the losses by using a grid only for your shack or even only for the lineair, using at least 2.5 mm² for shorter runs or even 4mm² wires, with a fuse of C16A or C20A . The PE wire (groud) also 2.5 or 4 mm².
While the acom 1000 needs only about 9 A, the 2000 needs 12- 14 A.. These currents are mean ones, the peaks are much higher because when loading a capaictor bank there is almost a short for a fraction of a second (1/100 s). Not even the fuses are fast enough to 'pop' at these peaks. These peaks can be 10x the mean current, and there fore it is necessary to have a good built home grid.

Hallo

I think it is normal that the amplier leds show the power while the tube is heating, the amplifier status is then in stand by.
In stand by mode, you have to see also the power leds light up when transmitting.

So, when the amp is ready to transmit and you press operate there is no amplification of the input signal ?
I would check the input some voltages inside : the screen, the bias , ...
There are some test points on the boards.
Warning : lethal voltages inside

do you have the schematics ?

Thanks Dirk for your input. It is common sense to take that approach I think.

I did exactly the same, replaced the 1.5 mm² for 2.5 mm² wires. Also rewired the whole house from 1 mains phase to 3, whereof phase 1 is solely in use for the shack. (No other electric apparatus is connected to phase 1 than shack equipment). Also intall a 30 Amp mains filter to keep the rubbish out of the mains and some ferrite clamps (model 43) avoids currents floating while pushing RF into the sky. Installed here in the shack, and operates without any error for 9 years now.

Result: A 3 volt drop under 10 amps load :-)

For the Acom 1000 is a 10amp SLOW fuse more then sufficient. The GU74B tube was designed for 750 Watt maximum (although also used in pulse systems, but that is a different operating mode) so far less than 10 amps is what the amp takes.

For wiring a good electrical grid to your shack it is best to use at least
2,5 mm², for a fuse use a 16 A (wich is ok with the electrical code)

The acom 1000 uses max. 10 A, 6 A are still available for ohter stuff in the shack.

If the run of cable is more than 15 m, I should use 4 mm² , still with
a 16 A fuse at the box. And if you ever want to use a bigger brother '2000' ... maybe under the next x mas three...

gl

Just an update....I picked up the Acom 2000a today. It has a replacement original RCU. When you turn it on you get an error stating the serial numbers doesn't match. This does not affect the operation of the amplifier. I am looking forward to getting it on the air. Thanks for all of the good advice

Yep, kind of a nuisance but as you say it doesn’t hurt the performance.. Wish there was some way to sync the serial numbers up so you didn’t see this “error” message every time you turn the 2000 on. You will enjoy the 2K, wonderful amplifier.. 73s Jim K4JAF

6208. 2000A startup after long storage

Yahoo group: acom-list (2010 — 2016)
Date: 2014-12-31 12:20:30 UTC
From: david@...
Topic: 6208 Message: 6208

I seem to recall this has been covered but a search of the postings did not reveal it...
My 2000A has been in storage (indoor, dry, room temp) for 4 years since I relocated from California to UK.
I'd like to get it back in service, but believe there should be some caution re potential dried-out electrolytics, gassy tubes etc.
Any of the fine minds on here got recommendations for startup?
TIA
David G3WGN WJ6O

What will your 240v Acom 2000A do when meeting with 100v on the power cord? It will quote HAL and say, "Sorry, Dave. I can't do that." And then shut down.

I think you plug her in as normal and see what happens.

But only leave it on for a few minutes to start with just in case the
big caps are leaking too much. Bring the duration up slowly to give
them chance to reform. That is unless the design of big caps has
changed significantly. Better than blowing their guts all over the inside.

Hi David,

I would remove the two Molex connector pins of the filament voltage from the mains transformer big Molex connector. (You can do it with an appropriately think plier) and connect those two *only* to the molex connector pair. It is a good time to check if they are oxidized (often they are after many years).

I would run the tube with only heating on for a day or so. Then connect reinsert the two filament pins into the molex connector and connect the molex connector pair normally.

Usual disclaimers apply: No liability accepted. Proceed on your own risk.

I am not an A2000 owner but have the A1000.

I have had a similar scenario with the A1000 and all I did was plug it in. Let the internal diagnostics do their thing and let it run for a couple hours before applying RF. My theory was - these are "smart" amps - so just let them do their thing.

YMMV. And I'm no amp expert!!!

Happy New Year

I would agree…just plug it in and let the internal diagnostics take over. Operating at a much lower voltage will cause the CPU and other digital circuitry to not operate, and the amp may not come on at all. I can't say that it might damage the amp, but I can't rule it out either. I would let it run in standby for an hour or so before running at full power.

Most of the problems with low ESR electrolytic capacitors were traced to a manufacturing problem in Taiwan that existed in the early 2000's and was fully discovered by around 2003. Equipment manufactured in those early years might have had the capacitor problems (Google "capacitor plague") and probably would have failed by around 2007 to 2008. Big electolytics can still fail if left on the shelf too long, like 'boat anchor' equipment that hasn't been powered on for decades.

I have an Acom 1000, and it has an "auto operate" feature, which places the amp in operate after warmup. It can be turned off so it just goes to standby after warmup. Check the manual to see if the 1010 has the same feature, and how to change it.

Hi All,

I recently purchased a used Acom 2000A. I've used them in the past at a multi-op contesting environment, so I basically know how to use one.

Since the amp does not have to be on the desktop, would there by any harm to the tubes or any other components by running the amplifier vertically? That is, turn the amplifier turned on its side, with the Acom 2000A label horizontal, power supply (transformer on the bottom) ?

I assume the amp would be fine, but I'm not sure about the tubes.

Thanks!

Tom, N2SR

Tom, I 'm not sure about the ACOM, but most amplifier tubes with closely spaced elements (particularly cathode to grid) the chance of sagging grid wires is increased when mounted horizontally. The most common failure in the GU-74B is control grid to cathode shorts. I would avoid mounting the amp vertically.

HNY,
Sig

the gu74b is designed for stationnary and mobile communications.
Any position is allowed, for rough mobile use there is a special socket where the tube is hold.

for the 2000a no problem.

Thanks for all the helpful replies.
My conclusions:
- Starting up on Variac maybe does not make sense in this case, given the likely effect of low mains voltage on the control logic/circuitry. It's my standard practice for boatanchor kit, but is not in the cards for the 2000A
- the amp is smart, but I want to give it the best chances I can, so "switch on and hope" isn't my preference
- the star - or "start" ;-) prize goes to Zoli. I have the pins pulled and the amp gently cooking...
Another exciting installment in a day or two...

I just got my new Acom 2000A (latest series with new RCU) hooked up and it will change frequencies by sensing the RF but it is not tracking with the Icom CI-V CAT interface connected. I selected the Icom Cat in the setup menu, made a cable with eh required (2) 510 Ohm resistors to pins 2 & 3 with ground don Pin 5 but nothing happens. Anything I am missing here?

Craig,

Are you using a PC in your CAT configuration?

What Icom Radio are you using?

Have you programmed your radio’s CIV buss speed the same as the ACOM CIV buss speed?

What CIV interface are you using: ICOM CT-7? Or something else?

If you are using a PC, take the PC off the CIV buss & try again directly connecting ACOM to CIV and ICOM radio to CIV.

Once I get your answers to the above, I can probably add more comments.

No, there is no Auto "do not auto operate setting" or Auto "adjust the drive on the exciter" setting, according to the manual
The Acom 1500 has a feature that lets you disable "auto operate after warmup" but the 1010 doesn't have that. With my Flex I run DDUtil which resets my drive level to the proper setting when I press the operate button on DDUtil it toggles my drive level from 100 for barefoot operation to the 81 level I use with the Acom. Still I have to click that button and remember to click that button when it needs to be clicked. Ham radio is hard. you actually have to do things, OMG :-) :-)

Of course it could :-) Seriously if an opinion is asked one is given. If you're gonna ask the manufacturer there are other ways to do so. If the list is asked then we'll give our best answers.

Have a happy New Year.

In this case it is not the remembering that is the issue, if you are running 100 watts bare foot and the amp finishes it's warmup in the middle of a transmission, then you blast 100 watts drive into the amp. Guess I will have to put a switch in the amp keying cable.

Thanks to all who replied.

Hi Joe,

1st of all, HNY!

The stated below is a down side of an tube amplifier, waiting until the tubes are warm enough to TX. If that is supposed to be an issue, why not chosen for a solid state amp instead?

From: Skip Guenter
Topic: 6239 Message: 6240

I'm using said amp with the TS-590S and the setting (menu 53 on the 590) is '2' out of choices: 'off', '1', '2' and '3'. For my older 3-500Z amps I use '3' for the longer keying delay.

Setting 1 equates to using SS switching and a delay of 10ms.
Setting 2 equates to using the relay instead of SS switching and a delay of 10ms.
Setting 3 equates to using the relay instead of SS switching and a delay of 25ms.

Hope this helps.

The follow-up is the plug is fine. Going to "Active High + Relay & Delay Control" is working but I'm seeing spike in power before settling down to normal power, ie; 1000W, then 860W. What do you think Ray?

Try reducing your ALC drive level to minimize the initial power spike.

This has been noted with the 590 previously, but not with the 990 until now.

From: N2TK, Tony
Topic: 6245 Message: 6245

I was going to hook up the RS-232 on the 2000A according to some info I had seen about hooking up the amp to the K3 so that the amp tracks the loging program to tell the amp where the K3 is at - band and frequency. Just realized the diagrams are showing a 15 pin D-sub connector on the amp. My 2000A has a 9 pin D-sub RS-232 connector. Am I missing something?

Tnx

If it is not a drafting mistake, then just take the schematic and "convert" it to 9 pin.
Not sure if it would work, but:

Serial (RS232) modem cable (DB9-DB15). Pinout and signals for building a serial (RS232) modem cable
So, on the schematic, from the DB-15 connector, pin 11 becomes 1, pin 13 becomes 2, pin 12 becomes 3, etc.

Hi Tony: This issue confused me too when I got my 2000A earlier this
year. After I figured it out I put together this mini tutorial which
should help:

++

When operating an ACOM 2000A with an Elecraft K3, there are two
possible modes of frequency control. Each mode requires a different
cable.

When a PC is NOT connected:

Use a cable like that shown in figure 7.6 of the ACOM 2000A manual.
You should set the K3 AUTOINF menu option to "nor", the default. In
this mode the 2000A will poll the K3 for band data and will change
bands accordingly. The K3 will also send band data when you manually
change bands on the K3.

When a PC IS connected:

Use the cable shown in figure 7.2 in the 2000A manual. You should set
the K3 AUTOINF menu option to "nor", the default. Note that this
cable does NOT have the TXD wire going to the ACOM 2000A, but it does
have the TXD wire running between the legs of the Y connector. This
cable can be either a single cable terminating in two DB-9 connectors
or it can be a single cable with a "Y" adaptor connected at the DB-9
end. In either case, it must be the electrical equivalent of figure
7.2. In this mode, the ACOM 2000A gets band data information ONLY
from the logging program, not from the K3. If you close the logging
program, the ACOM 2000A will not follow band changes from the K3. You

can still do band changes by sending a "dit" as explained in the ACOM 2000A manual.

Hope this helps.

I have an early 2000A. There are no connectors on the RCU. There is just a cable coming out of the RCU that plugs in the amp.

There are two D-connectors on the amp - one for the RCU and a 9 pin.

Does replacing the RCU with the new style give you the capability to allow tracking of the amp with the rig/logging program by having a 9 pin RS232 on the RCU?

Yes.

This is the key new feature of the new RCU.

The original RCU / AMP is not controllable in much the same manner without 3rd party software.

Guys,

Having a 2000A track a K3 is a CAT issue, not an RS-232 issue. Bill, W6WRT, correctly pointed that out earlier in this thread but I'm not sure everyone caught it. I have a "new" RCU and an "old" RCU on my pair of 2000As and I'm having to buy another "new" RCU in order to get tracking for my older 2000A. That is the way I understand it but I would love to be proven wrong if there is a simple way to get tracking without buy a new RCU.

Anybody need an old RCU? ;-)

Topic: 6239 Message: 6255

I have discovered that using "Active High+Relay" and "Active High+Relay & TX Delay Cntrl" are the only two options that will excite the Acom 1000 amp. Under both settings power spikes (75-150w @45w drive) are being observed intermittently on keying. Is anyone else observing power spikes during tune-up or operation?
Thanks
Carl

Yes.

This is the key new feature of the new RCU.

The original RCU / AMP is not controllable in much the same manner without 3rd party software.

I have an early 2000A. There are no connectors on the RCU. There is just a cable coming out of the RCU that plugs in the amp.

There are two D-connectors on the amp - one for the RCU and a 9 pin.

Does replacing the RCU with the new style give you the capability to allow tracking of the amp with the rig/logging program by having a 9 pin RS232 on the RCU?

Hi Tony,
I too have the Acom 2000A with the original RCU.
I'm driving the Acom with an Icom 756 Pro III, but the software I will mention both support K3 as well. Both have free trial versions.
I'm currently using the N4PY software. In my case, I bought it for Icom and you have to make the special Acom cable (ONLY use the 3 pins mentioned, I believe it was 2,3, and 5, and 2 and 3 should be reversed for Null Modem on the other end of the cable). If any other pins remain connected (for instance a store-bought DB9 cable with 9 wires) you will have trouble.
Good news, once you make the cable it should work with all the available software.
OK, N4PY's software will let you interface the Acom so it auto tracks the rigs frequency. This works perfectly. He also has a Standby/Operate icon. Beyond that, there is no provision to monitor anything else on the Acom. So, simple but does the job.

I'm currently looking at TRX-Manager, which can launch a separate window called TRX-Acom. I've only downloaded the trial version which only works for 30 minutes at a time (TRX-Acom only 15min) but it does a nice job and tracks the rig's frequency. This interface is more robust and has provisions to monitor any setting and feature on the Acom (bias, hv, drive power, rf out, reflected, and many more). The thing I like about this is you can also position the window within your cluster of windows for N1MM.

Both programs can be linked to N1MM, and both would require a piece of third party free software that allows comport sharing (N4PY recommended VSP-MGR by K5FR, you just email the author, he will send you a link).

Ultimately, N1MM will see the rig as a Kenwood TS590 because of the com-port sharing. Email if you're interested in how the com-port sharing works, it takes a few minutes to set up but is worth the effort.

I have both pieces of software up and running to control the Acom. Both companies have great customer service and answered emails and requests very quickly.

Any ALC overshoot (RF spikes) will trip an Acom 1000.
Have tried to run with an FT-847 but these are well
known for spikes and sure enough it trips the amp.
Only needs around 100mS delay so the amp can switch
and all is ok.

I have tried small circuits on both the ALC and TX inhibit
both of which work but stayed with the TX inhibit as this
was easier to use with the sequencer I have (homebrewed).

Strangely my TS-2000's also have an RF spike but neither
seem to be enough to trip the amp.

Only use the Acom 1000 on 50 and 70 (modified)MHz
so not a clue if this is just an HF thing.

Bob...
I have not experienced any faults. I did go into the rig settings and restrict max power to 55w on all bands hoping this would provide some protection, but I'm starting to think it's not. Normally I drive the amp with 45-50w which will provide 750-950w output depending on the band. To see the amp spike to 1.0 - 1.1KW is disconcerting, but if it's not faulting it must not be hurting anything, right? But what if I want 1KW output. Will it spike 1.2+KW, and if so will it fault then? I really don't want to find it's limit but feel restricted to a lower output level due to the spikes. What are your thoughts,
Thx
Carl

Typically the lead in spikes, on a % basis, are smaller as solid state
radios go higher in power.

Are you seeing this on CW or SSB and with what measuring device?

Both. I tune on CW and operate on SSB and see it on both from the watt meter on the Acom 1000 as well as a stand alone MFJ watt meter. Your correct, the size of the spikes are usually percentages of the drive power. Also, the spikes are intermittent, approximately 60-70% of key downs. Thanks

I think you may just be seeing some normal wattmeter fluctuations – if the amp is not tripping out, it is not likely that you are actually getting spikes – as these would trip the amp.

The Acom has protection for just this sort of problem.

The MFJ meter is not fast enough, and the internal wattmeter is not known for its absolute accuracy either.

If you were using a Array Solutions Power Master wattmeter, this would show you if you truly had spikes as it’s probably the only wattmeter fast enough to measure them.

Topic: 6245 Message: 6278

Well, got it working. Thanks for all the suggestions and help I received.

First of all, it seems the new RCU has a 15-pin D-sub connector which makes it easy to interface the 2000A to track your rig.

The older 2000A's do not have this connector on the RCU. They only have the 9-pin D-sub connector on the amp.

Tried using LP Bridge which I use to run all the following at the same time - DXBase, N1MM, AXETTY (FSK RTTY), K3/KPA500. Tried using "Output Comm Port #1". This is fixed at 4800 baud. Seems the 2000A likes 1200 baud. Maybe get Larry to change it to a variable baud rate?

AB2E came to the rescue. Suggested I try N4PY Pegasus Plus. So I bought it and added it to LP Bridge. What's another program running. J

Followed the instructions and made up a null modem cable using pins 2, 3 and 5(gnd). Setup the program as per the manual (real simple). So now the amp presets and tracks the K3. Now no need to send the dit.

Now I need to play with N4PY to see what all the program can do for me. This was a cheaper fix than buying a new RCU.

Was also told TRX-Manager works well interfacing the older 2000a's.

The reason I think it's spiking is because there was NEVER any fluctuation in power when using an ICOM proII with either the Acom wattmeter or the MFJ wattmeter. It was rock steady at the expected power-for-drive input. Seems to me if the wattmeter was too slow I would never see a spike or fluctuation. Whatever the issue is, and hopefully it's no issue at all, it's just not acting as it did with the ProII and didn't appear to be normal to me. Thanks for your expertise Bob,
Carl

When I bought my A1000 it came with a spare tube of unknown history. Is there somewhere that I can have it tested? Also, my shack is in the cellar, I live in New Hampshire, and it gets pretty chilly - 55 F or so. Considering that the humidity is very low is there a reason to worry about the warning regarding condensation?
Thanks in advance for any information.

73, Pete N1TCH

I have a 2005 vintage 2000A and although my tubes' parameters are showing fine I decided to order a pair this past week from Vine Antennas in England. They have a custom built test fixture where they can test the tubes under varying parameters.

Not sure if there is anyone Stateside that can test it other than putting it in an amplifier.
You can contact Array Solutions to ask how they test the tubes. Shipping the tube to England and back for testing would not be economical.

Hi Dave,

This isn't meant to be a criticism of Vine. They were easy to deal with
and lived up to their quality statement.

Do you have any info on the test fixture now being used by Vine.

It used to be that they tested the GU74B's only up to 400-500 watts or so.

This gave me fits with a single tube ACOM1000. The supposedly good tubes
would not put out any where near 800-1000 watts. Several returns to get
a good one. They finally found a good one by going the extra step of
testing a few tubes in an ACOM1000 rather than their test fixture.

With a two tube amp like the 2000, one would notice this less.

A few years ago there was an article in QST to build a transmitting tube tester. They did use current limiting for plate, and grid. The unit was built to test 3-500Z and 3CX1500s, but I'm sure the basic design is adaptable for the GU74.

In fact, I wonder if it's possible to take the circuitry from an amp that uses the GU74 (Ten-Ten Titan II, Alpha 91B, Acom 1000, etc) and build a testing circuit.

According to their web site, Vine now tests each tube in an Acom 1010 amp on three bands for RF performance. Maybe that was implemented after you had issues?

Since Vine individually plots the tube characteristics vs varying values for grid bias they use that data to match the tubes.

My friend received a set of tubes from them a couple of months ago and they are working fine. Mine will be here tomorrow.

I hope a rep from Array will chime in on what they use for test procedures.It would be nice to know how they do it so others looking for tubes can have a choice of suppliers.

OK. That was what they were doing years ago. The ACOM1010 has the
following specs:

750 W pep, 500 W CW.

Pete

I have tested many NOS or long time on the shelf GU74B 's.
I put them in a socket, for only one tube you can make wire connections to the kathode.
Gettering a 'long on the shelf tube' is using lower kathode voltages (and only kathode) for some hours untill you reach the specification voltage.
Use a ventilator to cool the base of the tube during this proces.
You will find more on google or even on this forum for preparing nos tubes.

While the tube is 'hot' from the dissipation of the kathode wire you can measure for any possible shorts between internal parts : anode to grid to screen .... .
Even when the kahtode voltage is taken away you measure fast for shorts again. It is important that the tube is still warm while measuring, because internal shorts happens when the itnernal wires are glowing. Check for shorts also when the tube is cold.
If there are no shorts you can go further with testing in the amplifier.

In the amp , no transmit for 1 to 2 hours, then only ptt little anode current will flow, also for an hour or so.
then apply little rf , 5 w or so, more electrons will flow, for some minutes.
then apply more rf 20 w or so , in cw mode di or dahs no continues wave.
and by time you can apply more rf input power.
The time between first ptt and full power ,sometimes I use 2 hours.
If something is wrong, the amp will go in protection. Then the tube is one for ever on the shelf.

At the end for every tube the iddling current must be set, depending on the model of the amp the proces for to do this can be different.
After iddling setting you can test the tube for full power.

warning : even with only kathode voltage applied the base of the tube gets hot , if you thouch with bare hand/fingers you will have second degree burn wounds ! and when opening an amp there are lethal voltages touchable

I got this from Acom a while back

"It's easy to find out the bad tube if you have a 12.6V / 3.5A filament transformer or a DC power supply with the same voltage and power. Hook an ohmmeter between the cathode and grid 1 pins and feed the filament voltage for a couple of minutes. The ohmmeter will read very high resistance all the time, if the tube is good. The bad tube will start with a high resistance but you'll see how a short circuit appears when the tube gets warm."

You MUST have some cooling air over the pins when the filament is on. The filament dissipates around 45-50 watts and most of that heat comes out through the pins. The socket does a good job of removing pin-heat through conduction, although that heat sinking is not fully sufficient and air moving across the tube base and socket is a requirement. "Clip leading" onto the filament pins provides a lot less conductive heat sinking - hence more air is required. You can get away without heat sinking or forced air for moments - maybe a minute or two? Try this experiment - clip-lead onto the filament pins and power up the filament. How long before you can't keep your fingers on the pins? "Can't stand it anymore" finger temperature is around 60C. 60C is a great place to stop (not just with tubes - most things electronic).

Use an SK-1A socket with a chimney with an appropriate blower mounted underneat. Solder leads to each pin and mark these. This way you can have the tube properly cooled and you can measure on the go at the same time.

Also swing the tube while putting it on its side from left to right and back, do this a few times. No shorts may appear being in cold or hot (heated) conditions.

I have a 2005 vintage 2000A and although my tubes' parameters are showing fine I decided to order a pair this past week from Vine Antennas in England. They have a custom built test fixture where they can test the tubes under varying parameters.

Not sure if there is anyone Stateside that can test it other than putting it in an amplifier.
You can contact Array Solutions to ask how they test the tubes. Shipping the tube to England and back for testing would not be economical.

Use
an SK-1A socket with a chimney with an appropriate blower mounted underneat. Solder leads to each pin and mark these. This way you can have the tube properly cooled and you can measure on the go at the same time.

Also swing the tube while putting it on its side from left to right and back, do this a few times. No shorts may appear being in cold or hot (heated) conditions.

Hi group,

To all 600S solid state owners, Acom has put all the files, firmware releases, photos, manual, tools on his website for download. Just select the amplifiers section, select the 600S and choose downloads.

This tests only for shorts. My experience with NOS tubes (besides shorts) is low gain.

Hi OM Brian,

This email chain was about (1st response that is) internal shorts :-)

Low gain? Depends on year of make. I would say production years 1989<>1992 and younger than 2005 (2006<>now) are the better ones. One might disagree, these are just my findings after all.

6300. Pair of GU74b tubes from Vine

Yahoo group: acom-list (2010 — 2016)
Date: 2015-01-20 01:05:28 UTC
From: Dave
Topic: 6300 Message: 6300

Ordered a pair of GU74b tubes from tubes from Vine about a week ago. They shipped Friday and I received them in New Jersey today.

Burned them in for 2 hours to be safe (even though they were tested). Set the bias to 370 mA (EBS defeated). They work great. About 45 watts for legal limit.

Very happy with the process.

I'll rotate them on a regular basis with the originals.

Dave

When I was running the local comms Earth station (11 metre dish) it was part of the routine maintenance to install the spare 6GHz 1.5kW Klystrons for 48 hours running every six months. A tedious job groping around the back of the tube undoing wave guide flange bolts blind with a non-mag spanner and hoping not to drop the gasket into the PSU.

Happy days,

Mike VP8NO

6303. Changing SO-239 connector on back of 2000A

Yahoo group: acom-list (2010 — 2016)
Date: 2015-01-21 04:35:00 UTC
From: Dave
Topic: 6303 Message: 6303

Hi All,

After installing my new tubes I found the center pins on the RF out connector on the 2000A are slightly loose and not making very good contact to the center pin on the jumper cable. Putting slight pressure on the cable would cause the rx to drop and I was getting arc faults. Changing the cable did not resolve the issue.

I want to change the chassis connector to an Amphenol that I have and was wondering how hard it is to get to the board inside the amp to unsolder and solder the center pin of the connector? Has anyone done this to their amp?

Thanks
Dave

Dear Dave,

I know someone who did this. It's Paul Clemens DL4RAJ. Here are his results (in German language, perhaps to be translated by means of Google Translate):

/Nach einem halben Jahr immer h?ufiger Kontaktprobleme im Empfang und beim Senden (->"Arcing"-Meldung)./
//
/Vakuum-Relais als vermeintliche Ursache ausgetauscht (Relais wurde auf Garantie zugesendet, Austausch selbst vorgenommen)./
//
/Danach erst mal st?rungsfreier Betrieb f?r ein Jahr. (Im Nachhinein wei? ich jetzt, da? das Aus- und Einstecken der Koaxstecker bei den Montagearbeiten/
//
/den Fehler vor?bergehend erst mal beseitigt hat). Dann wieder die gleichen Probleme./
//
/Auf Ihren Tipp hin im Empfangsbetrieb bei Eintritt des Fehlers Relais ?berbr?ckt und festgestellt, da? es nicht die Ursache ist./
//
/Nach l?ngerer Suche mit Ausbau der beiden zuf?hrenden Koaxkabel inclusive der kleinen Platine im Ausgangszweig //konnte ich die Teflon-Koaxbuchse im Ausgang als "?belt?ter" ermitteln: Die H?lse f?r den Innenleiterkontakt ist im Innendurchmesser zu weit,vermutlich durch zu gro?e Fertigungstoleranzen./
//
/Der Antennenstecker wurde seit Inbetriebnahme der Endstufe ja nur wenige Male aus- und eingesteckt./
//
/Ich habe mir nun selbst von B?rklin eine Mil-Norm PL-Buchse aus deutscher //Fertigung (Teleg?rtner) besorgt und eingebaut./
//
/Jetzt absolut st?rungsfreier Betrieb. Ein Bild mit der Teleg?rtner-Buchse (links) und der original Acom-Buchse (rechts) habe ich angeh?ngt.//
//
/Exactly the same problems as you have! The center female pin of the SO239 on the Acom 2000A gets wide!

My Acom 2000A is more than ten years old. I am planning to replace both the SO239 by N-connectors.
(IMHO) N-connectors of Rosenberger, Suhner or Radiall are in more reasons of much better quality than SO239 (IMHO).

The INPUT connector is fairly easy to replace. The OUTPUT connector (at the side of the two tubes) is different and much more complicated. You have to remove both the tubes and several other parts to get near to the connector. Very complicated to do, but not impossible! You have to be very careful and note which parts you did remove and where they belong. I am considering a step-by-step instruction how to replace both the connectors.

That's all I can tell you for the moment.

Looking forward to your reply and conclusions. And of course opinions of others.

A few thoughts -

- If you are going to do this, or anything this complicated, take a cell phone picture every step of the way.
- Amphenol PL-259s have the proper center pin size, almost all of the bargain PL-259s I have come across are smaller. Some are a lot smaller. The $1 PL-259s hamfest special connectors are all useless junk. "Amphenol or not at all." You should be able to just barely finger-twist a 1/8th inch drill bit into the center pin.
- Junk SO-239s are just as common as junk PL-259s, and their biggest problem is a loss of spring tension. Replacing these is always a good idea but sometimes a lot of work. I have no idea what's on my 2000As. The quick work-around is to wrap a few turns of thin copper foil on the center pin of the PL-259. This works well but is of course not very elegant.

Yahoo group: acom-list (2010 — 2016)
Date: 2015-01-21 13:16:19 UTC
From: bobk8ia@...
Topic: 6303 Message: 6306

Hal is right on about the quality of some of the PL-259's being sold. I had a similar problem with my Acom 1000, the center receptacle of the SO-239 seemingly too big and a loose output connection. It turned out to be a smaller than spec PL-259 center conductor pin on the output coax. A commercial assembly no less.

I replaced that PL-259 with an Amphenol and all was well. Lots easier than disassembling the amp.

From: Jay Terleski
Topic: 6302 Message: 6307

Apologies for the wrong post to the group. Seems as if my auto-fill launched this message to the group rather then ACOM. Were working on sorting out a 2000SW antenna switch that partially works.

Topic: 6303 Message: 6308

I had the exact similar issue with my ACOM2000, the output female connector is simply too loose for a tight connection, a common ACOM issue I think, I simply took the connecter (out) cable I was using to connect the amp to the antenna switch box, put on a little more solder on the center conductor and it fits tight. fixed

Subject: Re: [acom-list] Changing SO-239 connector on back of 2000A

Dear Dave,

I know someone who did this. It's Paul Clemens DL4RAJ. Here are his results (in German language, perhaps to be translated by means of Google Translate):

/Nach einem halben Jahr immer häufiger Kontaktprobleme im Empfang und beim Senden (->;"Arcing"-Meldung)./
//
/Vakuum-Relais als vermeintliche Ursache ausgetauscht (Relais wurde auf Garantie zugesendet, Austausch selbst vorgenommen)./
//
/Danach erst mal störungsfreier Betrieb für ein Jahr. (Im Nachhinein weiß ich jetzt, daß das Aus- und Einstecken der Koaxstecker bei den Montagearbeiten/
//
/den Fehler vorübergehend erst mal beseitigt hat). Dann wieder die gleichen Probleme./
//
/Auf Ihren Tipp hin im Empfangsbetrieb bei Eintritt des Fehlers Relais überbrückt und festgestellt, daß es nicht die Ursache ist./
//
/Nach längerer Suche mit Ausbau der beiden zuführenden Koaxkabel inclusive der kleinen Platine im Ausgangszweig //konnte ich die Teflon-Koaxbuchse im Ausgang als "Übeltäter" ermitteln: Die Hülse für den Innenleiterkontakt ist im Innendurchmesser zu weit,vermutlich durch zu große Fertigungstoleranzen./
//
/Der Antennenstecker wurde seit Inbetriebnahme der Endstufe ja nur wenige Male aus- und eingesteckt./
//
/Ich habe mir nun selbst von Bürklin eine Mil-Norm PL-Buchse aus deutscher //Fertigung (Telegärtner) besorgt und eingebaut./

//
/Jetzt absolut störungsfreier Betrieb. Ein Bild mit der
Telegärtner-Buchse (links) und der original Acom-Buchse (rechts) habe
ich angehängt.//
//
/Exactly the same problems as you have! The center female pin of the
SO239 on the Acom 2000A gets wide!

My Acom 2000A is more than ten years old. I am planning to replace both
the SO239 by N-connectors.
(IMHO) N-connectors of Rosenberger, Suhner or Radiall are in more
reasons of much better quality than SO239 (IMHO).

The INPUT connector is fairly easy to replace. The OUTPUT connector (at
the side of the two tubes) is different and much more complicated. You
have to remove both the tubes and several other parts to get near to the
connector. Very complicated to do, but not impossible! You have to be
very careful and note which parts you did remove and where they belong.
I am considering a step-by-step instruction how to replace both the
connectors.

That's all I can tell you for the moment.

Looking forward to your reply and conclusions. And of course opinions of
others.

73! Hans.

6310. Spares

Yahoo group: acom-list (2010 — 2016)
Date: 2015-01-23 17:10:44 UTC
From: Jay Terleski
Topic: 6310 Message: 6310

Val,
I need to add to the spares list.

add two LV transformers for ACOM 2000A if you only have one we will take it.

We had one die last night on the bench. I need it as soon as possible, and one for a spar
This was in a 2004 amplifier. It was intermittent causing all kinds of issues for the customer, at least it finally revealed itself to us.

Can you put a box of spares together for me right away and ship it directly to us so we can get this transformer and whatever other spares you can fit in from my list.

Thank you
Jay

did not say it is ''crappy'', I believe it was my cable, I used NON Amphenol connectors, which have varied tolerances on the tip diameter, knock offs tend not to be exact. ?I am going to redo all my cables if not already Amphenol, with genuine Amphenol connectors.

Hi all,

Any high quality SO-239 connector will be good.
Perhaps in state side are easier to find Amphenol brand, but other quality brands (from Germany, Swiss, UK, etc.) as Rosenberger, Suhner, Radiall, etc. are very good as well.

If you had to put more solder on the PL259 to make it fit would you consider the Pl259 was crappy not the SO239 supplied by Acom??

You have to remove both the tubes and several other parts to get near to the connector. Very complicated to do, but not impossible! You have to be very careful and note which parts you did remove and where they belong. I am considering a step-by-step instruction how to replace both the connectors.

That's all I can tell you for the moment.

Looking forward to your reply and conclusions. And of course opinions of
others.

73! Hans.

I have read several forums regarding the disabling of the EBS circuit in the ACOM 2000a. Wanted to know what the consensus of the group is if this helps to disable EBS or not?

Thanks...
Rich

I have mine disabled. Tubes run slightly warmer on idle but well within range.

You can hear the difference in tx audio with it enabled vs disabled. Most people would be ok with EBS enabled but for those of us that are into audio it sounds better disabled.

So, what type of operating do you primarily do? That will determine if you should mod the amp.

Disable!

Your Acom 2000A will not get much hotter without the EBS.

It gives you better audio. It did with mine...

I think there’s some improvement in the audio, especially crunchy sounds with sudden high levels of modulation. I don’t notice much difference in temperature or fan running. I did the mod during other repairs to the amplifier, and the mod was super simple (a jumper), and readily accessible. This was on a late 90’s vintage 2000A. The mod is also easily reversed if you so choose.

Hello Bill,

In short:

EBS stands for Electronic Bias System. It regulates the bias voltage on your two tubes.

Low audio means low bias voltage
High audio means high bias voltage

While modulating the bias voltage will vary in a few steps, regulated by the EBS.

Those steps may cause audio distortion.

Of course this is only applicable when you transmit SSB or AFSK applications. Not with CW.

73, Hans.

That's hard to tell Guenter. My Acom 2000A is 10 years old.

Acom was very helpfull with information and instructions when I carried
out the (very simple to do) EBS modification.

You may have a look on my internetsite for more details and photo's of
the EBS modification:
http://www.remeeus.eu/index.php/ham-radio/linear-amplifiers/acom-2000a-ebs-modification-an
d-installation-of-the-optional-fan.html

Additionally you may read the e-mail of Paul W9AC and Marty KA7GKN of
February 9th 2011 for their opinion. You will find their interesting
mails in our yahoogroup directories.

Very interesting too is what W8JI wrote about EBS:
http://www.w8ji.com/electronic_bias.htm

Please let me know if you (or anybody else) need further information.

73, Hans.

Topic: 6315 Message: 6325

Yes, I remember that Acom helped Hans with the mod and specifically
recommended that the external fan be used in conjunction with the mod.

From: Hans Remeeus
Topic: 6315 Message: 6326

That's correct.

I installed the external Papst fan, but for other reasons. Sometimes I do 24 hours CW-contesting and the optional fan may help to keep the linear within a reliable temperature range. I am happy with it.

IMVHO the EBS modification does not really need the external fan. The mod will cause about a few degrees C more and will not harm your linear amplifier, in normal circumstances. But for 100% realibility you may install the optional fan.

With or without EBS mod: I always recommend to install an optional fan. Such a Papst fan as I installed is not expensive at all. It is not a lot of work to install the fan, but nice to do. And the fan is extremely silent. So why not install it?

73, Hans.

Rich,
What you've been told here is all correct but one thing you need to know
is that it voids your warranty.

Acom has provided the details on how to do it properly, but they do not
recommend it or do they consider it necessary. There's always a trade-off
of how to SWITCH (the S stands for switching) the bias levels throughout
the operating range of the amplifier. If you're into "hi-fi" transmit
audio, you may want to do this, but if not, your 2000A's are all fine as
from the factory.

I bet you haven't had any reports of a problem with your transmit audio?

While they're under warranty, you may want to leave them in stock condition.

73,

Bob W5OV

From: dxbuster
Topic: 6303 Message: 6328

SO-239 gets loose not because of the spring contact, but because of the PTFE insulator.
A simple surgery may restore the central jack tightness. Just remove about 3/16" deep of the white plastic. Use a hand drill and clean the remains with a sharp screwdriver. Much easier than replacement.

All,

Just for my information: Is it the Input SO-239 connector (from the transmitter), or the Output connector (to the antenna) which gets loose? Or both?

Tnx and 73, Hans.

The temporary fix is to craft a small polyethylene wedge from a piece of coax. Jam it between the pins and the existing insulation.

Rich,
What you've been told here is all correct but one thing you need to know
is that it voids your warranty.

Acom has provided the details on how to do it properly, but they do not
recommend it or do they consider it necessary. There's always a trade-off
of how to SWITCH (the S stands for switching) the bias levels throughout
the operating range of the amplifier. If you're into "hi-fi" transmit
audio, you may want to do this, but if not, your 2000A's are all fine as
from the factory.

I bet you haven't had any reports of a problem with your transmit audio?

While they're under warranty, you may want to leave them in stock condition.

73,

Bob W5OV

Had my 600S for three weeks and FINALLY heard the fan. The fan/blower was so quiet that I had to check where that very little noise was coming from. Years ago, I had a Henry 2K4 and the room filled with noise and my wife did not want to come in at all. I guess the noise was a good thing. Joel, K2QBV

Hi Joel,

Many amongst us think (totally) different :-)

This is not about GU74B tubes. Instead, there were questions asked about the Acom 2000A BIAS mods and if these are acknowledged by Acom. The answer is NO. Warranty voids when mod is applied. Period.

Have a nice day Sir,

@Hans: Indeed!

Hi Rag,

Sure we can switch back to English, that is not a problem Sir.

The only reason why these emails were CC-ed to this group: The fact that Hans imposes his very strong own opinions on the reflectors (this reflector is not the only one unfortunately) and next when others provide some additional information, these persons gets flamed and furthermore will receive more flaming emails to their private addresses. To show you guys what this HAM is really about and how he treats other HAMs, you are able to read these kinda emails and were informed this way.

With regards to the request towards Moderators: Taking the above in consideration, it becomes very clear that the person that should be expelled from this group would definitely not apply to me.

My sincere apologies if these posts were undesirable, but I simply had to respond to Hans' posts to show you guys what he is all about.

Back to chasing DX!

6354. Acom 1000 failure...

Yahoo group: acom-list (2010 — 2016)
Date: 2015-02-07 17:23:58 UTC
From: Fernando González, EC1CT
Topic: 6354 Message: 6354

Good day everyone,
A friend of mine EA1DR is owing an Acom 1000 amplifier that has been working out flawsely for a decade. Last week, he turned on
the amplifier and it didnt switch to tx. All the parameters on the screen seem to be correct so we went straight to change the tx relay as we were pretty sure that was the problem (it didnt switch at all). As the problem persisted after changing the relay we replaced the tube and watched everything else (bad capacitor, damaged components...). Now, someone mentioned it could be a deffective control unit. I´ve never heard about a failure like that on an Acom 1000 at least on this forum (as I recall). Any other clue where to start to look for would be greatly appreciated. I´gonna try to forward this message to Stan at Acom BG as well. Thanks and best 73 to all.

Hi Kees,
NO. The amps turns on perfectly but doesn´t switch to transmission. Appart of that, the owner states that it has SWR ratherly high now on the circuit...in case this might help.
Thanks for your fast input, Kees...always a pleasure. 73

Hi Fernando,

That was actually my next question, is the SWR high on the input?

Few more he can try:

1) Is de Acom SO femail connector its middle pin not loose?
2) Change coax cable between TRX and amp.
3) TRX is not TXing on wrong RF output?
4) Change TRX
5) Examine the inside of the Acom amp, start at incoming RF coax
6) Wish him good luck on the K1N :-)

From: Dave
Topic: 6335 Message: 6359

Hi all

Started having an issue with Acom 2000 having G2 Control fault on band change. This is very intermittent.

About two weeks ago I installed a spare set of tubes I just received from Vine Antennas. I set the bias after install to 370 mA. This is 2009 vintage amp.

Other thing is I use DDUtil to have the amp band change following SmartSDR for Flex. I didn't notice this issue until I started using the latest beta of DDUtil.

Could there be a serial command being sent that could cause this issue?

Thanks
Dave wo2x

Where did the amp end up (band, segment?) when fault occurred. You
might have to restart the amp (with no software control) to tell.

Does going back to non-beta cure?

I will rest later and see if there is a pattern to the fault (from a specific band or to a specific band).

I have not had it fail with DDUtil 03.09.03 or older.

I have located another DDUtil beta tester with a 2000A and he is going to try and replicate the fault tonight.

Wondering exactly what the G2 Control fault is.

Dave,

I had once G2 Control faults when the band switch was not working well. Some oil in right place helped.

I'm was using Acom and Flex with DDUtil. Whenever Flex changed frequency, I could hear that Acom is doing short tune, even if there is no need to do it. I think that is not good for my amp.

All in all, I have stopped using DDUtil control any more. My Acom 2K is more stable now. Full power, without retunings. If I need (remote)control it, I use TRX-Acom.

73, Timo OH5KW

6363. Acom 1010 fuse question

Yahoo group: acom-list (2010 — 2016)
Date: 2015-02-17 23:51:45 UTC
From: AB4BJ
Topic: 6363 Message: 6363

My 1010 is set up to run on 120 volts. The manual calls for 10A 240V fuses when set up for 120. I blew a fuse last night and found that my 1010 was set up with 10A 125V fuses at the time of purchase. I'm inclined to follow the manual but am not sure why something different was used when the amp was originally set up. Any thoughts?

I have a 1011 and when I purchased it from the distributor, the fuse "left" in the holes were the same old 6.3A @ 240V fast blow as shipped from the Acom factory even though the local distributor left the plug for 120Vac which is what I use it with.

At any rate, I "quickly" blew the 6.3A@240 V AC fuse after attempting to tune it up once I got it connected to my 120Vac mains, fresh out of the box.... I think I made it to about 400 watts and "poof" went the fuse.

I went to Fry's here in North Dallas and located the correct, 10A @240Vac fast blow rating and I have not blown a fuse since..

Running on it on 120Vac requires a higher current than it would off of 220Vac (hence the 6.3A fuse requirement)

In looking at both manuals I see it's the same rating for a 1010 as a 1011.

I've lost 3 tubes in the last14 months but only a single fuse since 2011 when I purchased it. Radio shack only carried the slow blow fuses.. That's another story....

I went with the manual and have not had any issues (as expected) from a fuse point of view.. Just make sure it is a fast blow and the correct current rating.

How about remote operation? Has Acom woken up to the fact this is important?
The 2000 is a non-starter for remote since it can get into a fault state the current software offerings cannot clear.

Is rotation really necessary? NOS tubes sit around for years and work fine if you let them getter a while before applying full drive.

True, but with a little ingenuity, you can fix that. I run a 2000A by remote, and I simply soldered a pair of wires across the circuit board where the Enter button is and connected it to a remote relay. I use the N8LP remote board which handles the job well enough, although there are a lot of cheaper alternatives and probably many that don’t require a remote desktop at the remote site.

Hi Steve,

This is what you need!
http://www.remoterig.com/wp/?page_id=1010

This is an interface with a built in webserver, no need for pc at remote site and ni remotedesktop...no hazzle.
been using it for a couple of years with the 2000 amp and works excellent.
Browse at the remoterig web and you will get a lot nice ideas how to enhance your remote operation.

I have an extra Acom 2000a. It is sitting unused for several months now.
I have two locations, one in Yuma, AZ and one in Hattiesburg, MS.
Now I use remoterig to operate the station in Mississippi from Yuma.
I only used this unit during the winter months when I was in Yuma.
It is expensive to ship due to the transformer, and its size.
I have been contemplating offering it for sale to my local DX club where a local pickup could be done.

From: Rich Hallman - N7TR
Topic: 6371 Message: 6371

I am noticing in one of the 4 Acom 2000A's that I have that when auto-tuning the amp in the 14100-200 segment that I will get 200-300 watts more out than in the 14200-300 segment, even when I have tried a new user defined auto-tune setting. Seems like I also need to drive the amp more and noticed the amp runs hotter in the 14200-300 segment.

Anyone else seen this? Thoughts?

Jim,
Have you look at grid current, and plate current readings in these various band segments and look for correlation. Also there is a Gain value add that to the correlation list.. Your symptoms makes me think that the "tuning" is out of calibration or synch. Have you tried manually retuning/matching at the substandard band segments?

Then you would be wrong.:) The keying circuit is resistive with an open circuit voltage of ~+13VDC and a short circuit current of ~11mADC. Page 5 of the CONTROL PCB schematic shows this clearly.

The schematic I have is earlier than 2014 but I don't think the keying circuit has changed based on a couple that I have tested. Why don't you just measure the open circuit voltage and the short circuit current with a multimeter

The Acom 1010 lists the required fuse sizes on the back of the amplifier as well as in the owner's manual. Unfortunately the European 20 mm size (physical size) is uncommon in the US and rarely available at your local hardware store. Good to know they can be found at Fry's, but we're not all lucky enough to have a neighborhood Fry's. They can also be obtained online from Mouser.

Another good way to blow a fuse in your 1010 is by over-driving it. The Mfr-suggested drive power is 70w. Yes, you certainly can exceed this by a small amount, just beware that among other intrinsic issues, excessive drive causes the amp to draw excessive current. For example, with the 1010 wired for 240v the actual measured current draw (from the AC line) when properly tuned is approx. 5.6 amps with 70 watts of drive. In theory we could extrapolate that and expect twice the amount of current (11.2 amps) when operating the 1010 from half the voltage (120v) with the same 70w of drive. If true, this would therefore make me question the validity of the mfr's selection of only a 10-amp fuse for 120v operation, especially fast-blow.

With 85w of drive, my Acom 1010 (wired for 240v) while operating with a line voltage of 241vac, draws 6.4 amps (measured with an Amprobe) and shows 6.24 amps when measured with a Fluke 80i-410 current probe. Either way, with 85w of drive it would seem that you're operating right on the ragged edge of your fuse rating. Of course the fuse will take it. 6.3a fuses don't actually blow when the rated current is reached, but typically blow once their current rating is exceeded by 15%. Still, that's not a lot of headroom.

Similarly, the mindset that prevails in some circles about changing to a lower transformer tap value to result in a higher secondary (B+) voltage would seem misguided. and very ill-advised. Such "advice" does indeed increase the B+ voltage, but also increases the tube filament voltage (among other operating parameters).. I would be interested in reading others' thoughts on this matter.

6382. Re: Pair of GU74b tubes from Vine

Periodic rotation is only necessary for the purpose of giving you a warm & fuzzy feeling in knowing that you have spare tubes immediately ready to go in service in the unlikely event they are called upon. In reality, when you buy spare tube(s) you would certainly want to rotate them into operation initially just to verify that they're good. It's tedium, sure, so one option would be to pull your current (known good) tubes, put in the spares and let them getter for at least 5 hours (my opinion) and then bring them up to full power slowly, i.e., 50% at first and run them like that for 2 or 3 hours before bringing them up to full power and run them for another 2 or 3 hours. Now it's decision time, either leave the freshly conditioned spares in service or pull them & go back to your originals. Considering the time it takes I would be tempted to leave the newly purchased spares in service and shelve the originals & log their service dates so you have some record..

Others may have differing opinions.

From: Kees - pa7two
Topic: 6363 Message: 6383

Wasn't 70 Watt the maximum advised power input for an Acom 1010? I would not even drive the Acom 1010 above 60Watt input power (SSB & CW), same with the Acom 1000 units. This to safe guard the GU74B tube and spec-ed down components (when compared to an Acom 1000, in example).

So, what are we talking about then? 85 Watt input seems way too much. Buy a bigger amp would be my advice if the 60 Watt input doesn't provide the output levels you want.

Fact is that the 10 amp fuse might be on the limit / edge when using the Acom 1010 on 120v Volt input and using max input RF power, agreed.

While the Acom 1010 owner's manual states that 50~70 watts of drive is all that is required to achieve rated output, I'm unable to find any specific mention that 70w is the maximum recommended drive or any precautionary statement warning the user about exceeding the 70w recommended drive..

What will happen with overdrive is that as you will draw additional plate current and additional grid current, which of course results in additional current being drawn from the AC mains while achieving slightly greater output. You may get away with this in 240v operation, but in 120v operation I would expect the line fuse to be the first thing to let go. In fact this (overdrive) may well be the most likely cause of the fuse blowing in 120v units while trying to squeeze out that last watt.

In the 240v variant, as we approach 85w of drive or higher you will begin to draw excessive grid current (G1 warning lamp comes on) and at 90w of drive you begin to draw excessive plate current (iP warning lamp comes on) - and if you persist, the "stupid switch" will crowbar the amplifier and reward your mistake with the red (F) lamp... that is, if you don't blow the line fuse first. In either event it appears that ACOM has incorporated enough failsafe systems to protect the amplifier from the most common types of operator error.

The above notwithstanding, since the manufacturer recommends a 6½A fuse in the 240v primary, I am at a loss to explain why there isn't a 13A fuse in the 120v primary. This is not a recommendation to replace the fuse with a larger one in 120v units, merely my inquiring mind wanting to know why not?..

Bill,

The manual for the 1010 says:

CAUTION
For 120 V ac operation, the fuses should be rated at 10 A; for 240 V ac operation, the fuses should be rated at 6.3 A.

If it is necessary to replace the line (mains) fuses, use only those that are permitted under local safety codes.

The two primary line (mains) fuses in the amplifier are located on the rear panel (Fig. 2-1). They are of the fast (quick blow) type, European size 5 x 20 mm. Use 10 A for 100-120 V ac operation; 6.3 A for 200-240 V ac operation.

Suitable types are:
For 120 V: 10 A 250 V 5 x 20 mm fast (quick blow), Littlefuse 0217010; Wickmann 1942100000

For 240 V: 6.3 A 250 V 5 x 20 mm fast (quick blow), Littlefuse 021706.3; Wickmann 1931630000

Further, the manual states:

b) Power Output: 700 W PEP or 500 W continuous carrier.

So, speculation about exceeding these limits is outside what Acom recommends, no?

If you want to run more power, you need a bigger amplifier.

Spot on Sir!

GU74B tubes were designed for 700 Watts output. Please keep that in mind at all times.

Understood...

so allow me to ramble, just a bit

Merely commenting because I have seen with my own eyes some of the monkeyshines that occur with reckless abandon with another (unmentioned) brand of amplifier. What I'm referring to is the transformer tap changes occurring on a certain entry-level brand of tube-based amplifiers, often within the first few days of ownership and of course always performed on the basis of "good advice" from other "experts"..

The harsh reality is that the output power increase amounts to less than 1 db and does not show up on the S-meter at the other end, while needlessly stressing the tube with a filament bright enough to read the paper by. The 3-500 filament spec is 5.0 volts (+/- 5%). Changing the transformer primary tap to the lowest available value (with the amp in question) does in fact increase the B+ but it will also increase the filament voltage by as much as 33%.

Preferring to believe that Acom owners might possibly come from better breeding stock, I mention this only in hopes that our more discerning user base would all be smart enough to never pull a stunt like this with their fine Acom amplifier.

The beatings may now begin.

That really doesn't seem like an answer...

Like the original poster, I too find it a bit unnerving to be in QSO and have the amp suddenly come on line unexpectedly. My rig cannot exercise explicit control over the keying line, nor in my opinion should it be expected to. Call it what you wish, I see it as a design flaw.in an otherwise great amplifier. What were they thinking?

The tube chimney exhaust is also dangerously hot both during and immediately following QSOs, especially CW. . Yesterday I measured the temperature of the exhaust air flow at the vent holes on top of the cabinet and found it to be 240 degrees F. That will burn your flesh.. With all the concern over safety and admonishing us to not attempt replacing the tube ourselves, I'm surprised that there's no serious burn warning. Considering all the other myriad cautions and warnings...

Actually I'm concerned more about the amp overheating. I know this has been asked and answered by Acom, but I would gladly sacrifice a few db of ambient noise for improved air flow volume through the tube. Yes, there's an optional fan, but then I'd need to have it sitting on top of the amp, which makes it look jerry-rigged. Is there any option to get a replacement (higher output) internal fan?

Will the 1010 not take the pusher fan that's optional on the 1000 / 1500 mounted on the back air inlet?

LOL... I thought FOR SURE you were talking about the AL-811s rear jumper line voltage adjustments until you mention the 3-500Z. I don't recall that fine of adjustment options on my ol' AL-80A or SB-1000 so must be a "B" thing.

My ACOM 1K is the only amp I have / had that isn't UNDER fused and I may do that next time it's off it's shelf.

Got some schooling today from a local electrician-friend.who now teaches electronics part time at the JC

First, the ampere-rating of a fuse is the amount of current the fuse *must carry* indefinitely **without** blowing. Blow specs vary depending on the amount of overload and the type of fuse, i.e., fast blow, standard and slow blow. In general with a 200% overload a "fast-blo" fuse is designed to break the circuit in 0.7 seconds. A standard-blow (didn't know there was one) is designed to open a 200% overload in 1.5 secs. A slow-blo fuse is designed to open a 200% overload in 10 seconds.

The *VOLTAGE* rating of a fuse only has to do with the width of the gap in the element *after* the fuse blows, so that the voltage would not be able to jump the gap. Hence the reason why you should never use automotive fuses in 125 or 250 volt circuits. As far as our Acom amplifiers are concerned, either a 125v or 250v fuse would be fine.

Per IEC 60127-2, a standard cartridge fuse must be able to sustain a 125% overload condition for a minimum of one hour, but open within 2 minutes or less at 200% overload.

My electrician/teacher friend was unable to explain why Acom would choose a 6.3a fuse for 240v operation vs. a 10a fuse for 120v operation. He agreed with me that logically you would expect to see twice the amperage fuse size deployed when the voltage is halved. Otherwise, if the 10a fuse is correct for 120v then we should only have a 5a fuse for 240v.

We did additional tests today with a calibrated Fluke digital amprobe using 70w of drive and 1500w dummy load and Bird-43 wattmeter, but with 236.6vacline voltage (measured under load) and the amplifier optioned for 240v mains: Results:
3.916 Mhz 70w in, 780 out 6.1 amps
7.260 Mhz 70w in, 750 out, 5.9 amps
10.103 Mhz 70w in, 775 out, 6.0 amps
14.2 Mhz 70w in, 775 out, 6.0 amps
21.3 Mhz, 70w in, 790 out, 6.2 amps (just a needle's width shy of 800)
28.47 Mhz 70w in, 800 out, 6.3 amps
I would like to do these same tests with the amp optioned for 120v, but there is a problem in doing that.

First of all it's a PITA to pull the amp down & change the taps, find a new 14ga cord, etc. but perhaps of more significance, my electrician/teacher friend informs me that the maximum current draw of any single appliance should never exceed 80% of the breaker size. Ergo with a std. 15A breaker as is common in most homes today, you should not draw more than 12 amps with any single connected appliance or device, For any such high current-draw appliances, the minimum circuit is supposed to be on a 20 amp.breaker. Indeed, if you check today's modern kitchen countertop outlets you will discover that they are 20-amp circuits, not 15-amp like all the other outlets in our home. Well now, isn't that special?

Unfortunately there is no air inlet on the back of the 1010. Everything comes from underneath, which could one day become a maintenance issue for dust, pet fur and etc. For the moment I broke down and put a 3" PC muffin fan directly above the chimney, but elevated it 1/2" with some rubber bump-ons to further improve air flow as well as minimize the fan noise. This has had the desired result of dropping the discharge air temperature significantly, dropping it from 240 down to 160, even after an hour-long stint last night chasing the CWT gang on 20 & 40m & the amp making max PO. I'd just rather not have to look at a $5 aux.fan sitting on top of a very nice looking $2k amp.

All seriousness aside, this might be slightly more accurate than my plug in the wall Kill-a-Watt thingie majigger. ;-)

I do recall someone telling me many moons ago that fuses blow at something substantially higher than the rating stamped on them for short durations to handle OFF-ON current surges.

Now let's take this and the info your VERY informative electrician provided... Seems to me if you're not running a 1010 at full tilt, at least for SSB usage you could probably run a 5A ceramic fuse and have a margin of extra safety!

So any idea how much any one of these numbers drop with say 55W or 60W of drive? Let's say on 40m? Does it drop to 5.06A at 60w on 40m (direct ratio of input drive)? Naw, that would be too simple.

.....
/3.916 Mhz 70w in, 780 out 6.1 amps //
//7.260 Mhz 70w in, 750 out, 5.9 amps //
//10.103 Mhz 70w in, 775 out, 6.0 amps //
//14.2 Mhz 70w in, 775 out, 6.0 amps //
//21.3 Mhz, 70w in, 790 out, 6.2 amps (just a needle's width shy of 800) //
//28.47 Mhz 70w in, 800 out, 6.3 amps/
.....

BTW, this sent me off chasing the diff between glass fuses and ceramic fuses. The reasons the ceramics are better and often used in amps was NOT what I would've guessed.

Because I've seen grey ceramic fuses sold as replacements for microwave ovens and in my 1000, I assumed it had something to do with RF effects on the fuse.

It doesn't.

Ceramic fuses usually have
1) a faster reaction time,
2) a higher AIC, and;
3) are usually HRC fuses (as by product of #2)
4) slightly higher in line resistance (micro ohms diff)

Acronyms: AIC = Ampere interrupting capacity. HRC = High Rupture Capacity.

eg. A glass fuse of has a 10X RC or AIC meaning, if it were a 10A fuse it can keep a 100A arc from passing thru it. Ceramic HRC fuses are supposed to be able to keep a much higher ampere arc from passing thru it, possibly 1000A. Often it's by being sand filled. Sand melts and

turns to glass creating a natural insulator.

BTW, Ceramics can be had in 10, 20 and 50 lots dirt cheap on feeBay out of China. Don't have a way to test quality but I've been using them for a couple years. Can only confirm they blow and equipment (old tube amp / old tube final radio) wasn't harmed.

Didn't know all that till just now. So thanks for info directly and via a push to a web search or two.

Now off to put some 8A ceramics in my 1000 and see how that works out ;-)

HEY, Just pulled them and they're glass 10A fuses that came in it.
Here's what manual says:

/The two Primary Mains Fuses of the amplifier are located on the rear
panel (Fig. 2-1). They are 10A///
//250V Quick blow, 1-1/4 x 1/4 inch Cartridge Fuses, Size □0□ Ceramic./

Well 8A ceramics in it now. We'll see how this works. If nothing else it'll tell me how hard I'm really running it on various modes.

Skip -

I too have one of the Kill-A-Watt model P4400 meters. It's a neat device for show-'n-tell when you're trying to sell someone on the concept of energy conservation and what various appliances around the house draw. Also handy for tracking the electricity cost of leaving your PC on 24/7 vs. turning it off. On the downside, the Kill-A-Watt meter only works on 120v and (per the label) is limited to 15a loads.

Going strictly on the basis of the information bestowed upon me yesterday by my electrician friend, coupled with the real-world working loads that I was able to measure in real time with halfway decent instrumentation, I did arrive at the conclusion that my 1010 amplifier is incrementally over-fused with 6.3a fuses in a 240vac environment. Yes, I'm pulling nearly 6.3a, but only for very brief, key-down tune-up periods. Back to the 10a fuses & 120v, it's looking like 5a fuses for the 240v environment might be more prudent. However, the thing I do not want to get started is "nuisance blowing", especially in the heat of battle in trying to land that rare one. - and no, I don't need nor want a bigger amp. I bought the 1010 because I am a firm believer in the first 6db of signal boost being your single best return on investment, not to mention a proportionally lessor chance of other intrinsic "issues".

Your remarks about ceramic fuses are well received and would no doubt be of potential benefit, though I probably won't go to that extreme for my 1010. I also just bought some spare 6.3a fuses from Mouser, but in retrospect and in view of test results would like to at least try my luck with 5a fuses.

In regard to current draw with reduced drive, I'm not going to spend a great deal of time with this and drilling down through multiple bands, but can provide the following numbers as they relate to 40 meters.
7.215 Mhz 60w drive, 600 out, 5.6 amps
7.215 Mhz 50w drive, 520 out, 5.2 amps
7.215 Mhz 40w drive, 400 out, 4.8 amps
7.215 Mhz 35w drive, 320 out, 4.5 amps
NOTE WELL that the wattage output stated here is the power actually measured by the Bird meter, not the power being indicated on the LED display. The LED display (at least on my 1010) is not real accurate in that regard, to wit:
7.215 Mhz PO on Bird meter = 600w, PO as indicated on the LED display = 700w
7.215 Mhz PO on Bird meter = 520w, PO as indicated on the LED display = 600w
7.215 Mhz PO on Bird meter = 400w, PO as indicated on the LED display = 450w
ALSO, ignoring the TRI LEDs and tuning strictly for maximum PO on the meter you can almost always achieve at least 5% to 7% additional output than you can by using the book method and centering the LOAD led. Obviously no one on the air will be able to tell the difference, but RF purists who live & die by their wattmeters will likely see slightly greater line current draw, higher plate current (and hotter chimney temperatures) as a result of their efforts.

I am not at all concerned about running my 1010 "flat-out", as the tube is in absolutely no imminent danger of harm, nor is the amp showing any G1 or G2 (or iP) warning lamps. If Acom can run the tube at 1KW in the model 1000, I'm sure it will survive a very long time at 750~800w in my 1010 . I only wish there was better air flow volume through the tube and will probably look into addressing this one the warranty period is over.

Finally, yes, I did in fact order a spare tube. I'm not paranoid, only a realist. I learned that painful lesson with my old Dentron MLA-2500. Even if I never need it, at the very least the spare GU74B will be an investment that will never lose its value. I already have plans to install it when it arrives. I found the online documentation for tube replacement in the 1000 and in reading that doc. it appears the process in the 1010 would be very similar, except the 1010 has only 1 bias pot for setting the idling current adjustment and no temperature sensor. With all due heed to safety, how difficult can it really be? I've replaced screen bypass capacitors inside a 20kw Gates FM transmitter before & lived to hunt again. :)

Bill,

That's more reduced drive info than I'd hoped for. Thanx.

The Bird readings are interesting as my PO indicated on the amp is higher than my (not Bird) meter reads also. Not as much as you've found but more along the lines of 6~10%. I'm gonna make a trip up to Dallas & Array solutions later this year and hope to purchase a PowerMaster II so will have an accurate meter to check this on my 1000 a bit further.

I don't know if you know of Tom Rauch, are a disciple or in another camp. I'm not a zealot but am a follower. Some interesting reading here about why to not tune for max output at the operating drive levels: http://www.w8ji.com/loading_amplifier.htm#Improper_Loading_of_Amplifier

I've proven to myself that this holds for 3-500Z tubes. Tuned for max at a given drive level, over time I degraded an NOS Amperex tube faster than it should have. Reverting to "Over-Coupled" tuning essentially stopped the downward output trend and the old Eimac that's in that old amp now has shown no signs of dropping output in some time. This was pre-ACOM days.

I hope / believe the TRI slightly over-couples the tuning cap and further I think / hope it makes a compensation for the reduced power it tunes at so it's still over-coupled when the attenuator is removed. Being able to garner another 5% would tend to support that theory and is what I've seen on a manual tune also.

Anyway, by the time evening rolled around yesterday I'd already forgotten that I had the 8A ceramics in the amp. I participated in but was not the net control in WAS nets on SSB 40m, 75m and 160m nets with a dead key power indicated on my meter of around 700W. The 8A ceramics held fine.

I have a NCS gig on 20m RTTY today so I just set up and ran the macro that's the longest single script (very long) and a couple others shortly after at about 350W into the dummy load and the fuses held. Dummy load got pretty warm ;-)

I've got almost 6 months left on the original tube warranty and would like to swap in a new one at that point and put the original on the shelf. I may take the amp on my Array Solutions trip and make arrangements to have them put a new tube in it that day. I'm under the assumption these ceramic tubes don't need to be rotated like my 3-500Z tubes.

Good stuff or as they say "FB".

Skip

.....
40 meters.
7.215 Mhz 60w drive, 600 out, 5.6 amps
7.215 Mhz 50w drive, 520 out, 5.2 amps
7.215 Mhz 40w drive, 400 out, 4.8 amps
7.215 Mhz 35w drive, 320 out, 4.5 amps
NOTE WELL that the wattage output stated here is the power actually measured by the Bird meter, not the power being indicated on the LED display. The LED display (at least on my 1010) is not real accurate in that regard, to wit:
7.215 Mhz PO on Bird meter = 600w, PO as indicated on the LED display = 700w
7.215 Mhz PO on Bird meter = 520w, PO as indicated on the LED display = 600w
7.215 Mhz PO on Bird meter = 400w, PO as indicated on the LED display = 450w
ALSO, ignoring the TRI LEDs and tuning strictly for maximum PO on the meter you can almost always achieve at least 5% to 7% additional output than you can by using the book method and centering the LOAD led.
Obviously no one on the air will be able to tell the difference, but RF purists who live & die by their wattmeters will likely see slightly greater line current draw, higher plate current (and hotter chimney temperatures) as a result of their efforts.

In my opinion, "Rotation" is only necessary if you (1) wish to age-down your tube inventory evenly, and (2) want the comfort of having an immediately ready spare without having to go through the getter process again before getting back on the air In the amps with multiple tubes the same applies, tho here I would want to grade them by the discharge air temperature in the chimney and then seek to pair them up on that basis. My experience in that area being that the hotter tube is often more indicative of a weaker horse in the next stall or else something wrong under the hood. (i.e., cathode resistors).

In the reduced drive figures in my previous post I neglected to mention that those were "tune for maximum smoke" numbers rather than book method, only for the sake of showing what output can be achieved with lower drive. Speculation, but with by-the-book tuning you can probably expect 0.1a less current draw from the wall socket.

As far as wattmeters go, gosh, the new ones are sure pretty but I've been a Bird man for 40+ years and place a lot of trust in them. My current setup is a pair of identical Bird-43 meters ganged together in series with a 1-kw slug in the forward direction and a 25w slug in the reflected direction. I recently modded the forward-looking meter with the addition of an LNA Technology PR-90 peak conversion board. For consistency, there is a 3rd Bird-43 attached to the cantenna. Also just in case someone shows up at the door someday with a 2-wheel hand truck and graciously offering to let me test drive his new Acom 2000, there are appropriate-sized spare meter slugs in the drawer >grin<

I too have one of the Kill-A-Watt model P4400 meters. It's a neat device for show-'n-tell when you're trying to sell someone on the concept of energy conservation and what various appliances around the house draw. Also handy for tracking the electricity cost of leaving your PC on 24/7 vs. turning it off. On the downside, the Kill-A-Watt meter only works on 120v and (per the label) is limited to 15a loads.

Going strictly on the basis of the information bestowed upon me yesterday by my electrician friend, coupled with the real-world working loads that I was able to measure in real time with halfway decent instrumentation, I did arrive at the conclusion that my 1010 amplifier is incrementally over-fused with 6.3a fuses in a 240vac environment. Yes, I'm pulling nearly 6.3a, but only for very brief, key-down tune-up periods. Back to the 10a fuses & 120v, it's looking like 5a fuses for the 240v environment might be more prudent. However, the thing I do not want to get started is "nuisance blowing", especially in the heat of battle in trying to land that rare one. - and no, I don't need nor want a bigger amp. I bought the 1010 because I am a firm believer in the first 6db of signal boost being your single best return on investment, not to mention a proportionally lessor chance of other intrinsic "issues".

Your remarks about ceramic fuses are well received and would no doubt be of potential benefit, though I probably won't go to that extreme for my 1010. I also just bought some spare 6.3a fuses from Mouser, but in retrospect and in view of test results would like to at least try my luck with 5a fuses.

In regard to current draw with reduced drive, I'm not going to spend a great deal of time with this and drilling down through multiple bands, but can provide the following numbers as they relate to 40 meters.
7.215 Mhz 60w drive, 600 out, 5.6 amps
7.215 Mhz 50w drive, 520 out, 5.2 amps
7.215 Mhz 40w drive, 400 out, 4.8 amps
7.215 Mhz 35w drive, 320 out, 4.5 amps
NOTE WELL that the wattage output stated here is the power actually measured by the Bird meter, not the power being indicated on the LED display. The LED display (at least on my

1010) is not real accurate in that regard, to wit:
7.215 Mhz PO on Bird meter = 600w, PO as indicated on the LED display = 700w
7.215 Mhz PO on Bird meter = 520w, PO as indicated on the LED display = 600w
7.215 Mhz PO on Bird meter = 400w, PO as indicated on the LED display = 450w
ALSO, ignoring the TRI LEDs and tuning strictly for maximum PO on the meter you can almost always achieve at least 5% to 7% additional output than you can by using the book method and centering the LOAD led. Obviously no one on the air will be able to tell the difference, but RF purists who live & die by their wattmeters will likely see slightly greater line current draw, higher plate current (and hotter chimney temperatures) as a result of their efforts.

I am not at all concerned about running my 1010 "flat-out", as the tube is in absolutely no imminent danger of harm, nor is the amp showing any G1 or G2 (or iP) warning lamps. If Acom can run the tube at 1KW in the model 1000, I'm sure it will survive a very long time at 750~800w in my 1010 . I only wish there was better air flow volume through the tube and will probably look into addressing this one the warranty period is over.

Finally, yes, I did in fact order a spare tube. I'm not paranoid, only a realist. I learned that painful lesson with my old Dentron MLA-2500. Even if I never need it, at the very least the spare GU74B will be an investment that will never lose its value. I already have plans to install it when it arrives. I found the online documentation for tube replacement in the 1000 and in reading that doc. it appears the process in the 1010 would be very similar, except the 1010 has only 1 bias pot for setting the idling current adjustment and no temperature sensor. With all due heed to safety, how difficult can it really be? I've replaced screen bypass capacitors inside a 20kw Gates FM transmitter before & lived to hunt again. :)

So I gotta ask, In my finest hillbilly... Waddya think a 10 ohm woulda done in there instead as far as cooling?

.....

/I discovered a 22-ohm, 3-watt resistor (schematic symbol R-35) in series with the Acom 1010's fan lead. (easily accessible, located at the back left corner of the "Mains" board) With all due heed to the litany of safety precautions, I bypassed the crowbar & cover-present switch and found that there was a 3.8v drop across R-35 and with R-35 jumpered with a clip lead, there was a substantial increase in the fan speed. //

////

////

//With R-35 now replaced with a short piece of #20 wire and the amplifier cover back on, it was time for the acid test with another 20 minute SSB QSO followed by sending CQ for a solid 5 minutes into the dummy load. With a power output of 750w (70w drive) I was very pleased to discover the discharge air temperature was now down to a much more acceptable 175 degrees, a full 70-degree improvement. The tube was also cooling much faster, dropping about 1 degree per second at the end of the test. /

Topic: 6403 Message: 6404

Well actually, as Paul Harvey would have said, there's more to the story.

Turns out that R-35 is not the culprit that's slowing down the fan. While it does have that affect, the real purpose of the 22 Ω 3-watt resistor was to reduce the DC voltage on the fan to make it approx 12v (realizing that the original circuit would have had about 17 v there. (12v fans don't like 17v) Most likely in the original circuit the low side of the blower and the low side of capacitor C-14 (100 uf) would have been ground (as shown in the schematic). However, some clever person added R-35A (33 Ω) between the low side of the blower/C-14 and ground, ostensibly to slow down the fan and tame the noise. Obviously you can't always trust schematics when marketing types get involved post-design in trying to influence a design (and quell the fan noise).

Ergo a correct mod (and I will rewrite it) would be to jumper the 33 Ω resistor R-35A rather than R-35.

The approach of jumping the fan resistor (clearly marketing at work !) is elegant. The air intake on the bottom prompts me to add the observation that many of the "brag" photos we all do of our stations often feature elaborate wood shelving fashioned to fit the equipment.....and limit air flow. I credit Ray, K1KXN for leading me to open mesh shelving from Storables for stacking equipment. Highly flexible and cheap it significantly improved air flow around all my gear. My 2000A is in an open closet area on similar shelving as is the 1000. Further, I was able to lift all the gear off the desk completely thus gaining surface area to shove dirty dishes, empty cups and the like out of sight of visitors...and hide catalogs, of course. My QRZ page shows an older variant of this approach to cooling, aesthetics and bringing controls closer to eye level thus easing my neck, too. Jim K8JRK.

From: garfieldbill700@...
Topic: 6406 Message: 6406

Revised / corrected fix for ACOM 1010 overheating

Correction - the target of your jumper wire should be R-35A (33 Ω 1-watt) not R-35

I originally jumpered-out R35 (22 Ω 3-watt) because I saw it in the blower circuit schematic. However, R-35 actually has a valid purpose, or at least it would have, were it not for the post-production addition of R-35A which is not shown in the currently available schematic drawings.

R-35A is nearby, actually right next to R-35, so be sure to jumper-out the right one (Orange-Orange-Black).

What appears to have happened is the original ground on the low side of the blower motor (black lead) and the low side of C-14 (100 ufd) was cut and another resistor (R-35A, 33 Ω 1-watt) was added in series with the ground connection, ostensibly for the purpose of significantly lowering the fan speed and thereby reducing the blower noise. Mission accomplished, except now the tube runs hotter than blazes.

I don't know about the rest of you, but at the current price of $350 a tube, I can tolerate a lot of fan noise. Besides, I don't find what little noise there is all that objectionable. Just keep your mic gain and compressor gain in check and it shouldn't be a problem.

Results:

With the revised fan mod, the standby/idle exhaust temperature is now 102.4 degrees (previously 110)

5 min. dead-key, no modulation, no power out, idle bias only temp improved from 240 degrees to 195

5-minutes SSB ragchew transmission temperature improved from 285 degrees to 233 (whee!)

Key-up cooling time avg 1 degree per second, dropping from 233 degrees to 119 degrees in 2 minutes
During the 3rd minute of cool-down the temperature dropped another 10 degrees.
During the 4th minute the temperature dropped another 3 degrees
After 5 minutes of cooling off the tube was back down to 102.4 deg.

If you attempt this very simple mod, please work safe by following all cautionary statements and not being tempted to defeat the safety interlock.

The beatings may now resume

Hi Mike,

Problems, if one can actually speak about 'a problem' in this case, is twofold. Tube temperature in RTTY mode rises due to:

1 - RTTY mode is a (sort of) constant mode.
2 - Reduced RF level, as advised in user manual, pushes the tube into a less linear amplification factor and therefore tube produces more heat.

GU74B tube is most happy, temperature wise, in an Acom 1000 around the 700 - 750 Watt RF output. That is, in CW or SBB :-)

True about RTTY being a continuous mode and the tube actually being less efficient at reduced PO. One has but to simply 'hold the mic button down with no modulation and just the bias idle current flowing to see how hot it can get.

Regardless of mode and power output, it still seems counter-intuitive to me (coming from a background which includes some commercial broadcast) to risk the tube or shorten its life expectancy by deliberately cutting the blower speed (and air volume) in half because some MBA in the marketing department is leaning on engineering to make it quieter.

Mere conjecture, but from prior experience in corporate America I know all too well that the demands of Marketing carry more weight in the Board Room than the desires or needs of engineering. I just do not think cutting the fan speed in half was very wise. With exhaust temperatures exceeding 285 degrees during rag chews and CW sessions, I see it as creating a severe burn hazard in an unprotected/exposed area of the product. Water may boil at 212 degrees, but it takes only 1 second exposure to 160 degrees for human flesh to sustain a 3rd degree burn. (just my opinion)

700w output with 70w drive (mfr's recommended settings). Measured with Bird-43 into well-matched load (remote autotuner)

Just seems awfully hot to me & I'm inclined not to be so naive as to accept other users' anecdotal claims that theirs isn't hot. This is merely a casual observation on my part, not really spoiling for a debate.

I just turned the amp on about 5 mins ago, haven't used it yet. Exhaust temp right now 100.1 F as measured w/Taylor model 9842 and 98 F as measured w./Fluke thermal gun.

Now after 1-minute (60 sec) key down w/no modulation, just idle bias current, the Taylor says 163 and the Fluke says 147.

After 2-minute SSB transmission (700w/17 meters) QSO with W8YCM, the exhaust now reads 230 on the Taylor and 202 on the Fluke. This is with the fan speed increased (and with me much happier).

I'm a little more inclined to trust the Fluke, as I see it correlates with the ambient temperature here in the shack.

Bill,

When the Fluke was reading 202F what did the amp report as it's exhaust air temp?

.....

After 2-minute SSB transmission (700w/17 meters) QSO with W8YCM, the exhaust now reads 230 on the Taylor and 202 on the Fluke. This is with the fan speed increased (and with me much happier)

Clearly the factory ADDED resistor R-35a to slow the fan. Though it is not shown on the schematic diagram, the Mains board has been stenciled "R35A". The schematic shows the low side of the fan going to ground. It is in fact 33 ohms above ground. Vine Antennas even mentioned that the fan noise has been reduced in the banner info appearing above the product review on eHam.net. Good for marketing but not so good for longevity - in my opinion :)

The 1010 does not have that capability. One reason (of several) it's $1K less. Still $2.75 a watt and worth every penny, IMO.

Question: G/GM/GW ... land has a 400 watt power limit. I wonder how
hot it would get at 400 watts out?
Maybe heat isn't a problem at 400W even with the reduced fan speed.

It will work fine.at 400 watts. It's a great amp and I'm sure you'll love it.
The 1010 works fine at 700 watts too.
You do not have to perform the fan speed mod - that's just me being anal - I did the mod and feel it was justified, but again that's just me..

It's just that I don't (personally) like to run my amplifier as hot as Acom says it's OK to run this one, and I vehemetly disagree with the decision to throttle down the fan speed to placate a few who were complaining about the blower noise. If they'd turn down their mic gain and compression then the blower noise wouldn't be an issue..

The tube is rated for 200 C which is 392 F, but I'm "old school". In my day we always used to joke that if you didn't blow the tube out of the socket then you didn't have too much air. I don't have access to a wind speed meter, but if I did, I would like to see around 50 CFM flow.. The tube Mfr specs the minimum airflow at 20~25 CFM, but I don't like running thing at minimums. If they want 25, I'd like to give them 50. My only broadcast experience was with a Harris FM20H5 making about 19.5kw at the flange and with a blower loud enough that by today's standards you'd need hearing protection if you were going to be in the same room with it very long.

The one thing I definitely would NOT do use the RTTY setting. If you want to run reduced power, I'd tune it for max output (700w) and then decrease your drive to reign it in to your legal limit. I think it may run more efficiently like that. At 400w out you'll be too old to use it by the time it wears out.

Regardless how well built and how safe the operational margins are, I would still want the warm-fuzzy feeling of having a spare tube on hand... One that I had personally tested and knew was good and rotate it every couple years. That spare tube will never be worth less than what it will cost you right now. (my 2¢ worth).

Am I correct that running the 1000 or 1010 at less than 80% or so creates more heat because of the Class shift? Seems to me running a beauty like this at 400 or 600 watts is like driving a Ferrari around town in heavy traffic in 4th gear...

Maybe so but this is how Vine electronics tests GU74B tubes. They test
them at the 400 W level.

If the tube bias is unchanged, I doubt that the operating point is
changed from 400-700 watts. Gosh it's been a long time since I had to
"recall" anything about tubes.

All bets are off if the unit has "electronic bias control".

The amp was warming up fine for the contest made a few contacts then it shut down on the RCU with this msg.

I disconnected the main breaker hope it would start back up but no go. It will start warm up again but shut back down.

Any ideas before the contest starts ??

Thanks

One of the tubes is beginning to short. Initially you will find that the tube will intermittently short, and you will get a few more hours out of it, then eventually it will short at every start up. They short once the heater warms up, usually just before the 150 second warmup period ends. You can monitor the bias voltage and watch it drop down just before the amp faults.

Usually when the cap goes, it will fail at every startup, and the bias voltage will be low immediately at startup.

I've recently worked on two A2000s with this same scenario. Both had approximately 4000 hours on the tubes.

Unfortunately, as the fleet of A2000 amps gets older, I suspect we will be seeing more of these failures in the future.

I had the same problem last year. I sent to Array Solutions and the did a great job with fast turnaround. Two new tubes and new cap in bias supply.

Amp now as good as new.

Has anyone ever purchased GU74B tube(s) from QRO-Parts?. I see they have them for $219 (singles) + $44 ship.

Of course A/S has them for $600 in pairs or $350 singles - just curious if anyone had ever tried QRO-Parts and what sort of luck they'd had.

I ordered a spare pair from Vine last year. Fast shipping and just about $600 total shipped. Vine tests and matches the tubes based upon several grid current test points.

Not sure how Array Solutions does match testing. Maybe a rep from their company can say.

I think they'd need some kind of a bench test jig for matching, although I've been told that tubes with the same date code are also considered "matched". As far as swapping singles in the 1000 and 1010 I haven't heard of anyone having to readjust the idle bias current.

A friend said he'd gotten good service from QRO-Parts and they are $130 less for singles ($219) - saw only one mention of them on eHam.Net but it was favorable so am tempted to give them a try. It's only $$ right?

I agree with Joel. IMHO Vine is a very reliable company where you can
buy the GU74b.

Perhaps cheaper but perhaps with some more risks for the buyer, e.g. is
Boris UA1CCE. He sells GU74b and other tubes.

Subject: [acom-list] Sources for GU74B Tubes?

Has anyone ever purchased GU74B tube(s) from QRO-Parts?. I see they have them for $219 (singles) + $44 ship.

Of course A/S has them for $600 in pairs or $350 singles - just curious if anyone had ever tried QRO-Parts and what sort of luck they'd had.

Thanks

Regarding the GU74B, JUST GO TO THE SOURCE at Vine Antennas. On Ron's page you can find the testing system he has developed to test the GU74 tubes. Why would you go somewhere else. After all the money one has spend for these expensive amplifiers, dip down a little more and do the right thing. Over the last few years I have helped Vine sell a lot of these tubes and people are satisfied or received a replacement. In addition, he is easy to work with and on top of it all "a stand up guy". Google Vine Antennas in the UK.

I agree with Joel. IMHO Vine is a very reliable company where you
can buy the GU74b.

Perhaps cheaper but perhaps with some more risks for the buyer,
e.g. is Boris UA1CCE. He sells GU74b and other tubes.
http://forums.qrz.com/attachment.php?attachmentid=200804&d=1411647897&thumb=1
His source is in Russia and he posts them from Finland. His address is on qrz.com. I have no commercial or
whatever relation to him.

Others may have different opinions...

I ordered a spare pair from Vine last year. Fast shipping and just about $600 total shipped. Vine tests and matches the tubes based upon several grid current test points.

Not sure how Array Solutions does match testing. Maybe a rep from their company can say.

I am very happy with my Acom 1000. I purchased a spare tube to have on hand on advice from a ham friend locally. The tube came from Russia via Registered Mail and was “only” $155.34 including shipping. It’s comforting to have one on hand. When my warranty is up I will install this tube and keep the original tube for the spare. I am not worrying about a matching pair with a single tube amplifier.

Given the bias scheme of the 2000A, why would a "matched" pair of GU74B tubes be necessary?

The bias is measured for both tubes together. Why would you want one
tube pulling more current than the other?

Test procedure at Array Solutions, since you asked this very valid question, this is not meant to be a commercial.

The tubes we sell are tested as follows:

Before we get them they are first checked at supplier in Russia: They supply only NOS tubes, not pulls.
Date codes can go back to the 90s. But they say that every 5 years or so the military stock is tested for emission, shorts, etc. So some of these tubes will show tooling marks as they are inserted into sockets, etc. But they are NOS.

1. Hi-Pot testing of elements for shorts
2. Burn in Filaments (No HV on Plate or screen) for 8 hours
3. Then Apply HV and tested for:
a. Plate idle current
b. Plate current under load approx 300ma and logged with same input, grid current as well.
c. Power output

Shipped to Array Solutions and retested on our Gu84b tube tester: A converted 1010 amplifier.

We test again for idle current, plate current, input power noting output power and
temperature. Temperature is measured after tube is run at approx 450W for a minuet when the temperature stabilizes.

This gives us the ability to easily confirm operation and mate up matched sets.

I hope that clarifies the Gu84b testing of our tubes.

One other point some of you probably know, the green strip on the fins is temperature sensitive paint. It will turn very brownish if the tube was over exposed to high temperatures. Never buy one that has brownish looking stripe.

Interesting discussion. As an Acom 2000A owner and experienced eBay user, I'd like to offer my perspective. My amplifier requires a matched pair of tubes. Finding them from a bulk seller of untested tubes from Russia or Ukraine would be hit or miss. I might get lucky and get two usable pairs out of a group of 10. But I would have to worry how well the seller packs them, how poorly the shipper handles them, and if Customs handles and repackages them properly before handing them back over to the gorillas at the shipping company. Import duties are another consideration.

Once they arrive, I have at most 30 days, depending on the seller's terms, to test the entire batch in the fixture I would have to build while the tubes were crossing the pond. Any defects would have to be returned at my expense within that window to quality for an exchange or refund.

If my testing reveals no matches, I have to order another batch and start the process anew. If I find one pair for myself, I still have the remainder of the unmatched tubes to sell on eBay, competing with the same Eastern European sellers I purchased from. Only if I have the luck to match two sets does the deal become even remotely attractive, since I can sell a tested, NOS matched pair at a price just under what the "high-tier" sellers charge their "Gucci" clientele.

But how much time and effort have I invested? How much did I pay to build the test fixture? I'm sure I don't have every part needed in my junk box.

As a two-hole customer, I fell the testing services and warranty a reputable reseller provides represent a good value. They do the importing and testing, they eat the cost of defective product, they assume the warranty risk. In return for compensating them for their efforts, I receive a pair of tubes I can trust, with minimal hassle.

Guys,

Having gone through the tube replacement process on an ACOM1000. I'd like to supply some actual experience with these NOS tubes. This experience was several years ago and may not reflect today.

1) DOA is only part of the problem. They have to have sufficient gain.
2) Testing by the supplier was done at the 400 watt level. The ACOM1000 is a single tube 1KW rig

Here's what I recall.

I dealt with a reliable supplier (one of the ones mentioned in this thread)who tests the tubes. It took 3 returns to finally get a GU74B which would put out even close to 1000 W. All the bias levels of all tubes were adjusted in accordance with ACOM1000 specs. Despite this only one of the 4 tubes was capable of putting out more than 700 watts. The worst did only 600 watts. It was noted that the bias adjustments between tubes was substantially different. The one good tube supplied was tested at the supplier in an ACOM1000 (not the ACOM 1010) before shipment. Contrary to the comments below, the supplier indicated that they were getting a large fraction of NOS tubes that flunked testing. They were not DOA but simply out of spec.

I can't comment on the manufacturer or their quality control, but my experience indicated substantial NOS tube to tube variations in performance.

It took several months to finally get one good tube. Tube replacement in the 1000 is a bit more difficult that simply pulling out the old and plugging in the new. So that was an aggravation too.

YMMV

From: Jay Terleski
Topic: 6456 Message: 6456

Yes, I typed Gu84b instead of Gu74b. Thanks.

2. Bill we do not recommend amps come back to us for tube replacement. We have helped many hams replace and recalibrate the bias over the phone and also supplying the procedure. I think you are referring to the manual. But that is a CYA statement for ACOM if you ask me, just my opinion.

3. These tubes are very much available. Do what you feel is best. 4 tubes for $300 seems very attractive. Only one I found at that price level on EBay was $70 shipping was extra, but it was used. Most are at the $150 level today.

Regards to the group.

6457. Acom 1010 - Healthy Tube Regime & Protection Parameters?

Yahoo group: acom-list (2010 — 2016)
Date: 2015-03-31 15:40:06 UTC
From: garfieldbill700@...
Topic: 6457 Message: 6457

I see in the Files area a document for the '1000' that provides some excellent information in regard to Protection Parameters and Healthy Tube Regime Parameters. Unfortunately the information seems to be all Acom-1000 specific.

Where might one locate similar document(s) specific to the 1010 ?

If a similar document does not exist, could we prevail upon Acom to develop and provide same?

Seems the more I learn about this great amplifier, the greater my desire for more in-depth info. Yes, I realize that sometimes information can be dangerous. I also realize that the 1010 lacks many of the sophistications of the 1000, but the mere mention of the temperature-controlled fan piqued my interest, suggesting that certain tube temperature parameters might actually be of some concern to its designers.

I.E., irrespective of power output, if the fan in the 1000 automatically speeds up above 90C, and the Protection System raises a 'warning' flag at 130C and subsequently forces the amp into 'standby' at 150C... then someone please help me fathom the decision to significantly lower the fan speed in the 1010 for the sake of a 5 db reduction in ambient noise. That seems inconsistent with good engineering practice as well as justification for jumpering R35A (33 Ω) in the fan circuit.

Thanks in advance!

Thanks Barry.

Your results seem to mirror the results of others. I see no one on eHam.net or QRZ.com forums reporting any pattern of problems with NOS GU74B tubes regardless where they're finding them, so the fallout rate seems low enough to warrant taking a chance. I guess I'll find out, as I have one en-route, coming from QRO-Parts, supposedly Russian source but shipping from Sweden.

From: W1JCW
Topic: 6460 Message: 6460

Well the amp held up for the entire contest and kicked butt as usual.

How hard is it to get at this cap C2 on the low voltage board? Where is the low voltage board located ?

What is the value of the cap so that I may find a replacement and swap this out ?

I got a spare set of tubes when I purchased the amp so I good there.

I'll call Jay and get the setup for new tubes.

Thanks for all the replies.

You can work it out from the scale around the tune and load knobs. Max is max capacitance.

If the TRI indicator is left of centre you turn the load control clockwise, increasing capacitance. If the TRI indicator is right of centre you turn the load control anticlockwise, decreasing capacitance.

On the LOADING control, over-coupling is CW (right, less capacitance), under-coupling is CCW (left, more capacitance).

According to the superb W8JI website discussion on "Loading and Tuning Linear Amplifiers", if there is to be an error in tuning, it should be CW (over-coupling), as that results in lower screen current and better linearity. Apparently, under-coupling is bad news.

As a side issue, the "Protection Parameters and Healthy-Tube Regime" document from this website is very helpful:

Lemme rephrase this since I suspect one person is using bottom half of scale and other is using top half of scale. Does the MAX position = fully engaged cap plates?

Yes, MAX is MAX.

The reason I know this is that I've recently had the front panel off to replace the LCD module that had gone flaky. Part of putting the knobs back on is removing the RF deck cover and making sure that the cap plates were fully enmeshed when the the knobs are at MAX.

I have a table of typical T+L presets compiled when the amp was factory new sitting on the top of the amp for quick band changes and the settings only changed by a point or so after replacing the knobs.

The wrist action CW or CCW changes depending upon whether the upper or lower scale is used, I use the upper scale because the amp is desk mounted rather than shelf mounted.

Hope that helps.

6469. Acom 1000 Front Panel LCD Module Replacement

Yahoo group: acom-list (2010 — 2016)
Date: 2015-04-04 13:07:55 UTC
From: Mike Harris
Topic: 6463 Message: 6469

When not in use my mid 2006 vintage amp is always turned OFF at the rear panel.

My LCD started displaying the odd power block on the upper line power display. When the power indication subsequently swept over this stray it was erased when the power dropped to zero and all was normal. Eventually even more random blocks and other strange characters appeared when the rear panel power switch was turned on. In this state further activation of the ON/OFF switch on the front panel resulted in the display lighting up as normal but toggling a large block of rubbish characters on both upper and lower display lines from side to side at approx twice a second. The display was unusable.

When I raised this with the factory they confessed to having never seen this problem before. So if this is so hopefully most of you 1000 owners out there shouldn't either.

The infamous +5V supply was checked and found to be solid and without any ripple, the electrolytic caps looked good, no visible distortions, not cooked. My amp is mainly in standby as I usually search and pounce so seldom gets hot. Chimney temps normally 34C (22C room temp) resting and about 64C when running an RTTY pile at 700W or so. I fitted the optional cooling fan because of my RTTY and very occasional 6m EME JT65 operations. It was concluded that indeed there was an LCD problem. Occasionally on switch on all was normal so on the last occasion this happened I left the rear panel switch on until I received the replacement. Too many juicy DXpeds to chase.

It's not really a complicated job but one gotcha of the change out was that the power scale 0 - 1200W is not a detail of the LCD but rather a printed thin film which sits on the face of the LCD and held in place with a tiny dab of adhesive at the corners.

A bit tricky to transfer and align. It would have been much easier if:

a. The scale was preloaded on the replacement module.

or,

b. The scale was actually engraved on the inside of the plastic LCD cover fitted to the amp front panel.

Other than that no problem. With luck you will never have to do this.

Regards,

Mike VP8NO

In regards to the 0-1200 watt scale, the model I purchased new in March, 2014 has the 0-1200 watt scale etched in white on to the front panel above the LCD with the rest of the numbers and letters on the panel, like the 1500 model. The power output bar is on the very top of the LCD, just below the etched panel numbers.

I also turn off the rear mains on/off switch when finished using the amp for the day. Upon turning the mains switch on, the fan very briefly activates and stops; the LCD briefly illuminates and then goes dark with only "Acom 1000" showing below the mid-LCD dashes. Upon hitting the front panel on/off switch, the fan activates and the LCD illuminates with the warm-up period count-down starting. I don't know if this is the same sequence of events as older versions of the 1000.

Just had a look at the "Acom 1500" manual. I see the the change to the power scale. The printed numbers above the LCD are clearly a neat answer.

I wonder when the change over on the 1000 happened. It perhaps explains the lack of attached power scale on my replacement LCD.

With respect to switching the rear panel switch on. I can honestly say I have never noticed the brief fan run and will make a point to check next time. The LCD back light briefly illuminates, goes dark and ACOM 1000 is displayed on the bottom LCD row. The main start sequence is the same.

Personally I see little future in 1kW class tube amps. The continuing development of solid state HPA's has seen to that. My 1000 was purchased before the advent of the Acom 600S, of which we don't hear much or the Elecraft KPA500 (I run a K3). Both would suit my normal max power use. Not for me an OM Power 3500

On my 1000.

With the amp in standby, red front panel LED illuminated, LED display
dark but showing ACOM 1000.

Press and hold both the PREV and NEXT buttons for about 2 seconds.

To exit, press any button.

I discovered this whilst trying to find the menu to adjust the contrast
and back lighting after replacing the LED module. The menu flow chart
in my operators manual does not completely match what happens on my 1000
with respect to button presses. Firmware version isn't even listed.

Well I'm not going to die in a ditch over this but what follows is an extract from the front panel removal and replacement instructions taken from a collection I have from "Acom1000TechCD". Who authored it I know not.

<Quote>
b) Set two variable air capacitors to maximum capacitance (closed). Align the rotor- and stator- plates edges evenly in a plane. Thread one knob on the upper shaft (TUNE). Orient the knob mark to point to "100" on the scale. Holding the knob with one hand, tighten its nut properly (take care not to turn the shaft meanwhile). Then check that the maximum (closed) position is indicated by a "100" on the scale. Put the black plastic cap and press it gently until it locks. Repeat the procedure for the bottom knob (TUNE).
<Unquote>

Note that "100" is used instead of "MAX" and the bottom knob is LOAD not TUNE.

As previously mentioned, my caps are set as described above and the tune/load settings and pre set numbers are as they were when the amp was new.

The document is somewhat over 2MB with description and nice pictures, none of the caps unfortunately.

Regards,

Mike VP8NO

From: alpinesrgreat@...
Topic: 6478 Message: 6478

Greetings all,
Purchased an Acom 1k off of QTH and for all purposes with the equipment the individual has in their shack i have no reason to think anything besides it was getting full output when it was packed up as they stated.
Needless to say a ups trip from Washington to Wisconsin and she doesn't seem to be happy.
*I checked all connections. 1 to 1 swr in bypass and 1 to 1 when the amp is operating. (Only dummy load testing thus far.)
*With 50w Drive (2 Different rigs and 2 watt meters were all in agreement that it was getting 50 or dam near to it) The amp is only seeing 30w drive according to the indicator.
*The amp is operating and with 50 in im getting 600 tops out. (Drive is only showing 30 in)
*TRI indicator jumps around off scale after a moment and cant be brought in.
*I found a not so hot solder joint on the plate capacitive divider tower (the screw down into the tower next to the tube) It was a bad cold solder joint that loosened as soon as i removed the screw...
* Preformed a full visual inspection and replaced the wire and joints that i stated above and whipped out the DeOxit on everything.

I haven't powered it back up yet as i haven't installed a power receptacle at my QTH but i really hope that that connection was the problem. The amp is getting proper gain and output on what it says it is getting according to the on board drive power indication. But it isnt seeing the full drive be applied to it... swrs are all good and the TRI is jumping around after it is keyed up for a moment.

I was just wondering if anyone has ever seen anything like this.

73,
Steven McLenachen
KD9CNX

Can't say that I have specifically but having owned a couple of these units I would say that I would trust the meters on the A1000 more than most meters. I was shocked at how inaccurate my own meters were.

With a 30w drive it sounds like 600W is about right for this amp. I would see like 900W out driving with 50W but I have some Bandpass Filters between the rigs and the amps which reduces the power by maybe a dB or so. typically I'm driving the amp with 75w output from the rig whih turns out to be around 60W at the amplifier's input - but as I say that's the effect of mainly Bandpass Filters and maybe a couple stubs that are switched in and out per band.

I originally used FT1kMPMKV's set for 75W output and at the maximum setting I never had an overdrive situation. With the FT950 I can overdrive the amp if it's set up for more than 90W drive on the low bands. I could drive with 90W on 10, 12 and maybe 15m without a problem. 6m I drive very lightly 20w or so as I am always wary of running more than about 400w on 6m in my location with a few houses closeby.

I would complete the visual inspection and from there you sound to be fine. You can be sure of one thing. If there is a fault this amplifier will find it, too much gain, too little gain, too much input, too much SWR, high or low HV, high grid current, bad coax or traps (arc faults), this amp will shut down and let you know there is a problem.

Hope that helps.

Jay, just FYI - I've owned a couple A1000's and have had to remove front panels on both - one several times trying to troubleshoot a problem. I've always followed the instructions as provided in the files Mike mentioned. This has worked everytime without fail and my post-op settings have always matched closely the pre-op settings.

In the end it actually is just moot as if you tune using the recommended manner you'll get a solid tune - just not one that could be referenced from reading and trying to duplicate those settings or based on the settings noted in the manual for a 50 ohm load. The setting would just be different but the caps would have the correct levels of capacitance once the amp was properly tuned by the book using the visual indicator.

Thank you,
Yes no faults so far i have driven it with a couple of TenTec rigs and thru a couple of different watt meters and everything seems to agree upstream of the amp. but the amp says its getting lower drive. Ill print out a sheet that i know i have seen somewhere around here of healthy tube parameters to be sure even though the auto protection would politely tell me to be safe.
No faults and the amps seems to be happy just didnt push it when i saw it reading lower drive power than other equipment was saying. But as far as i can see in the schematic there is no input power meter it uses other circuitry to calculate it.

Back to the fellow ham that has 230 and a 1kw dummy load to check it out after my cleaning and monitor tube parameters as we crank up the drive a bit tomorrow hopefully. I was just cautious when reading 50 to 60 in for full output. But nobody specified if that was what the amp was seeing coming in or what the excitor was putting out.

Also i am probably being over cautious with the safety's that these amps have but in my line of work you should never rely on automated safety's if you haven't confirmed proper operation.

Thanks all,
KD9CNX

Steven

I think you'll be fine. I've owned and used a lot of amps and even though I had some bad luck on one of the A1000's - a bad transformer (shorting in the HV winding) - I am actually planning on either another A1000 or maybe an A1500.

The transformer failure made me do some reflecting but for the price and build quality not to mention reliability and range including 6m it's amazing value. Generally I was a bit worried about tetrode designs because of the complexity of the transformers compared to the typical triode design.

Maybe for backup amps I'll get a simple older Alpha with a simple triode grounded grid design - but these high gain Acoms are much more fun at a good price.

GL with the testing.

Thank you Dean - I completely understand your point!! Using the TRI is preferred, when at all possible.

The main reason that I want to know which direction is which on the LOAD control is that sometimes (especially during contests or when answering a rare DX station), I don't have time to do the normal re-tuning sequence using the TRI. Especially, one does not want to crank out a CW carrier on the frequency while tuning. So in a pinch, I might want to tweek the LOAD control in the proper direction to ensure that, if mis-tuned slightly, screen current will be on the low side (vs. high SC, tube-stress, and possible splatter), at the same time that I'm transmitting.

When I was running the HF Falklands - UK point to point TX station here in the late 70's, early 80's we had 7.5kW Marconi amps with 4CX5000A finals. Eimac supplied individual test data with each tube detailing the measured operating parameters, of particular note was the screen current at full output. We always adjusted the loading to match the the power out with the Eimac data screen current for the tube in use. No two were the same and can vary greatly.

It is surprising how many people feel the need to tune exactly on frequency in the belief that to do otherwise will damage the PA. Easy to find a clear spot a couple of kHz away for a four to five second tweak of the tuning.

I have preset data for both CW and SSB segments and on 18 and 24MHz tuning by TRI the numbers are the same! Without reduction drives on the Tune and Load controls it would difficult to split the readings. Naturally the antenna is well matched with good SWR bandwidth.

Regards,

Mike VP8NO

HI

I am experiencing exactly the same problem. Amplifier works and then I am unable to get it going due to IP and F lights flashing. I removed each of the tube and tried the amplifier and there is no IP and F lights flashing if there is either of two tubes inside the amplifier. As I put back both of tubes, there is IP and F lights flashing again ... every several PTT push there is no sign of this error:

How to solve this problem?

Thank you,

Ted, s51ta

I too have been a Ham since '77, I have just a couple simple questions for all of us to digest..

One.. Why do you expect to get 1,200 watts PEP out of a amp that is only rated at 1,000 PEP??

Read the spec's here under the Acom 1000: amplifiers
http://www.acom-bg.com/amplifiers.html

amplifiers http://www.acom-bg.com/amplifiers.html ☐

View on www.acom-bg.com http://www.acom-bg.com/amplifiers.html
Preview by Yahoo

Two.. Are you running it on 120V or 240V service. If either how much other draw is your circuit? Unless the supply circuit power is overdrawn I would expect a lower output like any other amp without a dedicated power source..

Three.. If the amp is older I would expect the tubes to be closing in on the end of there duty cycle.. Particularly if you have been possibly over driving it to the max all the time attempting to get 1,200 watts...

Please share with the group your take on this.....

Oh, one other thing to add..

What is the SWR presented to the amp?? Are you running a tuner after the amp or direct bypass from Amp to a antenna with a known SWR... What is the SWR?? The amp can handle only up to a certain point before the limiter kicks in..

Hi AB4VV,

Just my 2cents Sir:

The GU74B tube was designed for 750 Watts RF output. See manufacturers specification (Russian or Svetlana USA which talks about 50 Watt more as I recall for the same tube).

So before buying the unit, I was informed by myself by searching for the specifications that although the unit can produce more RF, it would be at cost of the life of the tube.

With some tweaking more RF can be obtained, than the 750-800 Watt, from the Acom 1000 but i.m.h.o. not recommended.

Subject: [acom-list] I feel that I have been 'Taken'

I bought my Acom 1000 about 5 years ago from Array Solutions for $3,150.00 or 3,050.00, I cant remember exactly. Now HRO is selling the same amp for around 2,500.00. Also I am actually afraid to use the Acom for long rag chews for fear of losing the transformer, like a lot of other Acom users have done.

Over priced NOS tubes from array solutions when compared to buying on ebay is another issue and like I said if I lose the transformer it will cost way more than it should.

Another thing is even using the Array Solution Power Master meter I have Never seen 1200 watts from my Acom 1000. Using a Yaesu FTDX 3000 I have to set my output power to 80 watts to see 1kw and on 40 meters I do not see 1kw at this drive setting, something more like 850 watts. I should add that the amp has not lost power over the 5 years I have had it, it is puttting out the same power with the same drive as it did from day one that I had it.

I am not a new ham, have had an FCC license since 1977 and have owned and used many other amps. So it is not a matter of a newbie not knowing how to load an amp.

I wish now that I would not have sold my Ameritron AL-80B. That was the most rugged and best bang for the buck amp on the market. Plus the tubes are still in stock and are not NOS. 3-500 tubes are still being made at a very reasonable price.

Oh well, live and learn

AB4VV

Having owned a couple A1000's and likely buying another - it is without doubt one of the best built amps I've owned. there are different classes of amps of course and this is in the top tier. I also own an Ameritron AL811A but it is without doubt in a different class - more bang for the buck or less information on the amp's operations depending on your perspective.

You're expecting an amp to consistently perform beyond its design specifications. That is not logical. There are several full output options including the A1500 and units from many other manufacturers, tube and solid state.

Equipment is meant to be used and every piece of equipment once it has been in service for a period of time will have various failure modes. You can't really "prevent" failure by not using it - it just leads to other modes of failure. Use the amp. If it develops a problem with the transformer replace it or sell but other than using it within specification I don't know there is much a user can do.

I have had a failure in the HV section of the A1k transformer so I can identify with anyone with concerns there. Interestingly it was in the newer of two units both of which originated in NA but before Array was the dealer. These transformers for the tetrode are somewhat more complicated and it's more difficult to find substitutes as you might with the triode designs. However having looked at all the options, prices and reliability etc, I keep coming back to the A1000. As someone mentioned there isn't much difference between these power levels - 1kw, 800W, 900W, 1.2K (except for increased electricity bills) - not gonna be much of a difference except for the very very tough rarest of DXCC for which we all have a reserve 1.5KW amp (don't we?) But the A1000 ticks nearly every box in a requirement for an amp except 1.5K and fully auto. For that we would need to double the price and maybe gain 1/2 an S unit.

For me, I'd stick with the A1k and install some more antennas with the money saved..

YMMV.

AB4VV,

While I respect your right to express your opinion and vent your dissatisfaction, you'll get no sympathy from me. Acom and Array Solutions are top notch companies, proven customer service and satisfaction over the years. Just check out the hundreds of reviews on various ham radio websites. By the way, I have no affiliation with Array Solutions, but I do have an Acom 1000, purchased from them.

Your rant on pricing differences has no validation. I was in the retail sector for over 40 years, and when it comes to product pricing, there are no guarantees, especially after FIVE YEARS. There are many forces that affect retail prices....changes in manufacturing costs, distribution expenses, currency fluctuations, competitive issues, inventory control, relative value to similar products, etc. You buy a product at a certain time and price based on your research, desire to own it, and ability to pay for it. After that, all bets are off...buyers remorse and a later lower price (unless there is a "low price guarantee" in place) are not the responsibility of the seller. In fact, look now at HRO and Array Solutions...the Acom 1000 price has increased to $2,750.

You're afraid to use the amp for fear of losing the transformer? C'mon....I guess you don't drive your car for fear of losing the transmission; don't turn on your air conditioner for fear of losing the compressor. Stuff happens. Anything made by humans can fail for any reason at any time. That's why they have warranties to protect you for a reasonable amount of time. After that, it's your choice to repair or replace, at your expense. The only "lifetime warranty" is if you die before the original warranty period expires :-)

You think GU74B tubes are cheaper to buy on EBay?...so buy them there. Nobody's twisting your arm to buy them from Array Solutions.

You've never seen 1200 watts from an amp advertised and rated at 1000 watts?...not even gonna go there. I "can" get 1200 watts out of mine, but why? Only 850 watts on 40 meters?...too many factors and variables to support that. No one on the other side could tell the difference anyway.

You sound so dissatisfied, I think you should sell the amp while the retail price is now higher, and re-buy your coveted Ameritron AL-80B. You'll even have money left over to sooth your buyers remorse. Just make sure you shake it first to make sure there are no components or hardware rattling around inside.

Just my opinion on your rant.

73 es GL,

Bob K7JQ

Your rant on pricing differences has no validation. I was in the retail sector for over 40 years, and when it comes to product pricing, there are no guarantees, especially after FIVE YEARS. There are many forces that affect retail prices....changes in manufacturing costs, distribution expenses, currency fluctuations, competitive issues, inventory control, relative value to similar products, etc. You buy a product at a certain time and price based on your research, desire to own it, and ability to pay for it. After that, all bets are off...buyers remorse and a later lower price (unless there is a "low price guarantee" in place) are not the responsibility of the seller. In fact, look now at HRO and Array Solutions...the Acom 1000 price has increased to $2,750.

You're afraid to use the amp for fear of losing the transformer? C'mon....I guess you don't drive your car for fear of losing the transmission; don't turn on your air conditioner for fear of losing the compressor. Stuff happens. Anything made by humans can fail for any reason at any time. That's why they have warranties to protect you for a reasonable amount of time. After that, it's your choice to repair or replace, at your expense. The only "lifetime warranty" is if you die before the original warranty period expires :-)

You think GU74B tubes are cheaper to buy on EBay?...so buy them there. Nobody's twisting your arm to buy them from Array Solutions.

You've never seen 1200 watts from an amp advertised and rated at 1000 watts?...not even gonna go there. I "can" get 1200 watts out of mine, but why? Only 850 watts on 40 meters?...too many factors and variables to support that. No one on the other side could tell the difference anyway.

You sound so dissatisfied, I think you should sell the amp while the retail price is now higher, and re-buy your coveted Ameritron AL-80B. You'll even have money left over to sooth your buyers remorse. Just make sure you shake it first to make sure there are no components or hardware rattling around inside.

Just my opinion on your rant.

73 es GL,

Bob K7JQ

Very good comments by all, esp. K7JQ and 8P6SH !!

It seems like two things affect the actual power output of the 1000 (besides the obvious: amp tuning and drive level) - the actual line voltage under load, and the gain of the particular tube in the amp.

My line voltage has virtually no "sag" under full load, and evidently the tube in my specific amp has a lot of gain. I have to decrease my drive to around 55-60w on most of the bands to keep the power output around 1000w. I can easily get 1200w+ with 80w drive on most bands. Evidently I got lucky with my particular tube.

I have talked to many hams that run the Ameritrons - most have commented that their amps spend a LOT of time in repair shops. The Acom appears to have a much better reliability history, and is a great product, IMHO.

Like anything new technology as it ages the price goes down. But most guy'like bragging rights , new stuff is alwsys pricey. As for power out, i have my ft2000 with 50 watts and whatever output i get, k-ser-rah. I dont try proving myself to anyone. If you bought a car gor 3000 abd a year later, well you get the point.

Hi, Claude (Sonny) -- if that was you who wrote this blurb. I guess I would be very happy to swap an AL-80B with you for your ACOM 1K. I've had ACOM 1K longer than you, and I have an ACOM 2000 also -- both have their place in my station.

I have conducted most of my ACOM business with Array Solutions -- Jay and Bob have been fantastic -- since originally getting the A-1K from Krassy, when he imported the ACOM amp. The salient point to be taken here is that people always seem to know the price of everything, and the value of nothing!

You have to do whatever makes you happy, and in this instance I would like to put a smile on your face. I will find a 'cherry' Ameritron AL-80B and drive down to swap it with you for that albatross you seem to be so unhappy having.

Good luck rag-chewing with the other die-hards on 75 SSB! 73, Vic, W4VIC

HI to AB4VV,

What you have is one of the best design amplifiers on the market, by far. I own the 1000, 1500 and automatic 2000 and after trialling almost very amp on the market, I could give you a dozen technical reasons for why you are way in front of the Ameritron by keeping your Acom. And I am not knocking the Ameritron but the Acom 1000 is so far superior, and it should be, it is in a different price bracket to the Ameritron of course.

On the pricing issue, this was way out side of the control of Array Solutions, a bulk deal was done which virtually undercut Jays very long term Acom business and it was done while he was holding stocks, so he felt the pain just like everybody. HRO are a big buying power who utilised that power in a massive first buy and it was felt all around the world, not just in the USA. The Euro has also been harsh of late and an expensive currency to play with, so this factor will see prices fluctuate from time to time. Also, it is of note that Jay issues a full check on every amplifier that hits US shores and this means you do in fact have full knowledge of the working amp in the USA. A previous poster mentioned voltages,110v versus 240v over here, yes, this can cause minor top end power capabilities but not massive differences. If you are achieving 1kw in the USA, this is correct for the Acom 1000. Can it do a little more, well the real question is, will anyone hear the small difference. My answer owning most models of Acom amps is that as you go from 1000 to 1500 to 2000, you will obviously see some s meter differences but in Australia, we are for the short term, limited to 400w so our acom amps don't even get warm, this will change back soon to 1kw fingers crossed.

Transformer failures can happen of course, but very rare in my experience. Tubes, I think the pricing is at a point of being extremely affordable now, a few years back, you would have had a heart attack as they were extremely expensive.

Hang in there with your Acom Amplifier, we have sold a huge number of them here in Australia and obviously enjoy the usage of the Acom amps personally every day. Jay at Array solutions has been such a great fellow dealer, often offering advice and experience that I must be honest, HRO just don't have. Array Solutions is a local American Ham radio company that has brought so many innovative products to the market, over here in Australia, they are so well respected and we support them whenever we can in comparison to the big gun multimillion dollar buying power outlets. And don't misread this as Jay is small, hes not, his stock holding is staggering, but it is his local support for you guys that has the hidden value for you guys in the USA.

Just my two cents worth

Hi Sonny,
Sorry mate, I didnt intend to make it sound like you were Acom bashing from your side,(although TAKEN is a very strong term) and your points are valid in your last email re complexity versus simplicity, but as Acom dealers here in the Asia pacific region, let me assure you that repairing them is not always as expensive as you think. Most issues are simple ones, the most common one is a 10w resistor that we see from time to time. And as an example, Acom is the choice of our Australian Military and some Asian Defense customers as well for quite a few applications. One of their criteria is ease of repair and with that, economy of repair. Admittedly, defense tend to use the Acom 2000A series of course, its just the best amp on the market world wide, but I am a bit biased of course. Its also the quietest and simplest amp to use, ok, now i am advertising unintentionally, but its just my favorite toy in the shack, especially since the new controller box. As a side note, we just started selling the new Acom 600S, nice amp in so many ways, good feedback from customers so far, so great advances from Acom.

On me being a black box operator and possible sensitive egos, I could not disagree more, I run an array of Optibeam antennas varying from 70' to 120' in the air and these are some massive arrays and the Acom Amps i enjoy love the optibeams of course. I also use an Icom IC7850, so in that, yes a black box, but I did spend ten years as head of the Asia Pacific Satellite Engineering division of Motorola so I have some technical background. I have over 70 radios in my personal collection(Hoarders USA have called haha) and love refurbishing older equipment as well. Another 19 radios are arriving on Tuesday, its a sickness haha..I tend to be quite an easy going individual, far from perfect let me say, but I smile every day and my goal is to put a smile on others faces, not disrupt their day with forum responses that may not have been agreeable by yourself. You have my sincere apology if anything I wrote was offensive or not to your liking, it was not intended to be anything but some input from down under. So, again, my sincere apology if I have offended you in any way

With that, your reply unexpectedly surprised me, I am great mates with Jay and I must say, having a shot at my ego or my lack of industry experience(back box operator) whilst trying to help/advise you was not expected. I was replying to the fact that you had felt "taken", and trying to differentiate the Ameriton versus the Acom, two very different amps. I did not acutely defame you in any way, I addressed your comments with some alternative points of view, and some information as to what happened to us all as Acom dealers worldwide. I believe supporting Jay in Acom sales is a great choice, when you need back up its a phone call away. All that aside, my apology still stands regardless. I want to grow

friendships, not the opposite.

Anyway, i will let you say what you want about me on this forum, it will not effect my outlook or my determination to push Acom forward, and least of all, ego, I certainly do not see any relationship with your comments about my ego and the comments placed about the Acom series of amps. I hope you can see that my response was in no way an attack on you, just some thoughts on our experience over here in Australia and the asia pacific region. My company which I started in the mid 1990's after being asked by Motorola to form(10 years with Motorola prior) managed to reach turn over figures of over $8,000,000 annually and we now have offices in Malaysia and China. Me, I have started semi retirement at the age of 50 and have appointed a new Managing Director both in Australia and in Malaysia to ensure I can enjoy the years ahead and the hobby I love so much. So my comments are based on my personal love of Acom, not my commercial interest in the product, I simply love the amplifiers the Bulgarians make with such expertise. I also understand that budget is always a consideration and some of your points and comparisons were noted and agreed to in my last response. Even I have to get things past my wife, I just had to buy her a new granite top kitchen to bribe her for my new Icom 1 of 150 IC7850 units, so I know all about constructive deal making and economy of movement. [?]

So Sonny, in short, no offence meant, actually I just want you to enjoy your amplifier. Here is an offer for you to assist you in your concerns re the valve etc, if you ever blow one up, I will donate one to you free of charge and you just pay the postage, our two countries are allies in so many areas and the last thing I want is for you to think there is any bad blood between us, there is simply not. If you have any problem with your Acom, both jay and myself are a phone call or email away, happy to assist anytime. I want good honest discussion for sure on forums, and that is what we are having, and I am happy to help you if you ever need it in any way. Us Aussies, we make a lot of noise but we are not a bad bunch overall, we just talk funny haha....I recently had an article on the Elecraft website as I have 3 K3 units, man did it blow up into a big mess, so I have had my own mistakes made on forum and not throwing stones in class houses is my goal in any conversation. In short, that issue resolved with loads of smiles on faces, even mine, so that was a great resolution. l did learn something, the title of any forum article is crucial, mine was, not too happy with elecraft, I regret my title as its floating around the web for an infinite amount of time regardless in the fine print, it becomes obvious that elecraft sorted the problem out.. I told you I get it wrong myself, so I am far from perfect myself.

cheers
Brenton
VK3CM
Tangambalanga(yes, its a real name, heres some trivia, Mel Gibsons old home town may years ago)
North East Victoria
Australia

PS below is what I still contend with in my semi retirement, thank god we sold the real estate company we owned as well with the list below.
Position and Navigation Systems Pty Ltd (Australia and Malaysia)
Praxis Multimedia SDN BHD (Malaysia)
Kiewa Valley Kennels(Australia)
Samantics Beauty (Australia) I unfortunately am disallowed from the spray tanning of naked girls etc,(weird, I applied for the job with my wife and was denied, quite ungrateful i thought) and waxing, well, my xyl seems to love ripping hair out, shes a dangerous woman with wax haha.
Oh, and Im supposed to fit in renovations on our acreage here as well, I think I might beg for my old job with Motorola back. I am not sure getting back to Chicago would be quite as easy as back in the 1990's, but I loved my 4 years there, you guys are a great bunch of people to work (and play ham radio) with.

I ALSO paid a $1000 more for my Acom1000. Added to that I ALSO paid nearly $1000 more for my TenTec Eagle over the current price - before TenTec was sold and the price was decreased. Now just waiting for Hilberling and Icom 7851 to drop $10,000 ! By the way my more expensive Acom 1000 has worked flawlessly over the years - I do not "protect it", in fact "it protects" me from my "operating flaws." So at the higher price I paid, I am going to make sure to get every extra cents worth, and more out of my "cherished" equipment.

I don't believe you'll find 3-5's under $100 anymore. As for ego's, I read the whole thread and didn't see any egos. It appears to me you are happy with the AL-80A/B and you should stay with what works for you.

Some time ago I had a AL80A (with the prime instruments transformer too) and I thought it was a very good amp.

73
Dale, k9vuj

If I could get parts for' the Acom 1000 at a reasonable price and tubes under a 100 dollars like I did back in the early 90's I would not be afraid of running the Acom all day and night. As it stands now, I know it will cost me money that I have but do not want to spend to run the Acom like I run an Ameritron. Sorry I stepped on some very sensitive egos here so I will say "73's...QSK... Short Time....Destiniated.... and may your store bought G5RV play well for you...

What you're saying isn't really that different from what most others have contributed.

I would agree with much of your thoughts. I too have found that the failures of the A1k seem to be very basic parts and mostly readily repairable. It is not however quite as "simple" as the Al80x. I also find that you need to depend somewhat more on technical support in troubleshooting because of the protections which make it difficult to energise the various circuits without "dealer-level" knowledge - often beyond the info available in the technical supplement.

BUT - since the A1k lets you know its various faults, you start troubleshooting knowing what is basically wrong.

Generally the price of tubes is increasing - the price of many of the classic triodes is very high - the 3CX1200 and 3CX1500 even the 3cx800 have become quite expensive and even if the 4cx800 is getting expensive - it's still cheaper than most of its triode cousins.

Of course the 3-500 is still quite inexpensive and I'm surprised we're not seeing new designs with that tube - but maybe there is only so much more designing that can be done with a grounded grid amp.

Whatever you decide - enjoy and hope to hear you on the other side of my coax with a full KW and sounding good. Congrats on your new insurance policy - now you can run your amp without fear :-).

WHAT did I miss about A-1K transformers? ? ?

Into the dummy load the A-1K said 46W in (radio set to 50W out, thru meters, switches, tuner, extrnl meter says 48W) gave me 740W out on 40m (724W on external meter, 7.189) when first put into service. Checked it a couple weeks ago still says 46W in with radio set on 50W and showed 736W out. That's well within tolerances of my junk meters.

Frankly the AL-80B is a great amp. Look at what the 'free' warranty is on various Ameritron amps. I'll think you'll find they know it's their most reliable amp also. 3-500Z tubes are great (other than shelf life) and the Chinese can make an acceptable one at that. Not an Eimac or Amperex but still. The "RF Parts" brand ones are better tested and with 3yrs on 'em are the ones to buy IMO.

I also have an AL-80A and had a SB-1000... great stuff but it's old stuff, like the TS-830S that feeds the AL-80A.

The single biggest thing that affects (perceived / metered) power output isn't line voltage it's SWR! Maybe not with a PowerMaster II (sure hope I get to test that out soon :-)

Sonny, I do know where there's a TL-922A and a fairly new AL-80B for sale between u and me (He's buying an A-1.5K) and we'll both be in Nashville in June.

Skip

There have been a few instances of shorted HV windings. I first noticed it in the reviews with this one ham from France really making several low rated reviews on Eham. I thought he was "ranting" and didn't see it as an issue.

http://www.eham.net/reviews/review/109873

However it actually happened to me in 2013. The amp was actually on and running at the time. I had stepped away from the shack to grab something and when I got back it had faulted and turned itself off. I turned it back on to find a PN07 fault which is basically HV. After a couple days troubleshooting with help from Val at Acom, we found a short between the 305V and 2800V windings.

The fix was a replacement transformer - 478 Euro including the shipping (very heavy of course).

Initially I was quite upset but I had bought this amp second hand and it had given me about 8 years service without any prior issues. That triggered a phase of major research around amps in general with an initial thought that I would move back to a pair of older Alpha 374A's or 76's and convert to the 3CX800 tubes. However when I considered all the factors including the cost of replacement tubes I concluded that the A1k even with this "issue" was better for my situation - the various protections etc. And just the technology differences between two different eras of amp building.

My interactions with Acom left me with another option - to use an A1500 transformer - maybe 100 Euro more expensive but I figured it would be coasting at 2/3rd it's rated output. However this needed some modifications - some drilling and rewiring. I decided to go with the direct replacement which was a plug and play solution. (I was thinking that the A1000 transformers might have been NOS sitting in a warehouse and just as old as the one being replaced - but transformers are still in production)

My other consideration is that here in Barbados we have very high humidity and high temperatures which have of course killed many a piece of equipment in the shack - so I also figured part of the problem might have been humidity since it has not presented itself as a widespread - based on my research and overall content of this forum.

I've also come across one other instance where a transformer had to be replaced in similar circumstances but of course I've seen loads more faults which required simple and inexpensive parts replacements.

That's my experience with the "transformer issue", Hope it helps.

Hi Dean, the most obvious question I can ask you being from VK is "when are you on 20m so we VK's can work Barbados" Certainly look forward to working you sometime in 8P6 land. Nearly got to visit in the 90's. Motorola stuck me down in Columbia and Venezuela for a stretch, Barbados looked so much more enticing.
Cheers
Brenton
VK3CM
PS interesting comments on the 1500 transformer into the 1000, we must remember that as an option if a transformer dies. Sounds like a few mods but some good gains. That being said, no transformer problems in the many Acom amps I own or have sold as a dealer over here in the Asia Pacific region so we have had a good run...

I'd like to throw in my 2¢ here.

Power transformers, regardless of the product they're in, is a major component that rarely fails. When they do and if there is a recurring pattern of these failures, then clearly something is wrong & it behooves the mfr to stand good their replacement, not so much in regard to product warranty as in regard to customer good will. This is not to suggest that they should come with a lifetime warranty, but for something with the cost and perceived quality of ACOM, the power xfmr would probably be one of the last components I would ever expect to see fail.

My only comment in regard to wattmeters is this; you either own a Bird or wish that you did. No, it's not a particularly elegant-looking meter, but you're unlikely to find one that's any more dependable or accurate. There are a lot of wattmeters out there, some cheap, some not so cheap and a few that are darned expensive. However, there are none that can claim to exceed the repeatable accuracy of a Bird-43 with the appropriate element. The several cross-needle meters are indeed very nice, but if I need to be able to simultaneously see both my forward and reflected power and know exactly what it is, I'll take a pair of back-to-back Bird-43s any day.

The LED "wattmeter" built-in to my Acom-1010 is not at all accurate, nor do I expect it to be. I find it to be at least 10% generous, perhaps a bit more, but for it's intended purpose as a "relative" indication of power output, it's fine. If I want to know exactly how much I'm putting out,I'll look at the Bird. With a 2.5KW slug that puts the meter reading near the center of the scale, the point at which it's accuracy is referenced.

Finally, the difference between 1200w and 850w is 1.497 dB (OK, let's call it 1.5). On the other end of the QSO a 1.5dB difference in signal strength is not measurable, period. If you want to impress the Op at the other end, put up a better antenna.

Well said Bill!

This is one of the reasons why I put up a 400 feet horizontal DeltaLoop antenna. The increase of signalstrength (TX ?nd RX) is amazingly! Not one linear amplifier on our ham market will give the same results as such an antenna does. Signal reports of 59+20/59+30dB on 3,7 MHz are no exception and even DX on all the HF-bands is outstanding.

Puting up such an antenna does not have to cost more than about 25% of the price of an Acom 1000. The only thing you will need is a nice yard ;-)

Have a look at
http://www.remeeus.eu/index.php/ham-radio/antennas-and-antennatuners/delta-loop-antenna.html

73, Hans.

Others may have different opinions...

It is a feeling, but some facts :
- the eur/dollar rating has chanched a lot in favor for EU export and US costumers
- acom is delivering very good customer service
- Transformator faults , it is rare
- gu74b , look better on the internet some urkraine and russian are selling these cheap, you can buy several for the price of one. Preheat these tubes yourself

I can have the same feeling op my top of the line yeasu transceiver, I bought one in 2010 , now I can buy one 25 - 30 % cheaper......

Enjoy ....

Dean - 8P6SH,

EXCELLENT summary. Thank you very much for the detail.

Yea, 8 years on a 2nd hand ACOM and an apparently infrequent issue raises it's ugly head, I might be drawn to the same conclusion. I might also think well I'll get a A-1.5K and still run it at the same level as I was running the A-1K but we all know how that can creep up on ya ;-) However, it doesn't sound like the fail had anything to do with the load at the time.

In the past if I got 2~4 years on an older used amp before having to do 'something' I figured I was ahead in the game. A transformer is a biggie though.

I had a LK500-ZC that had at one time been diagnosed as needing a new filament transformer. To replace just that part with the /correct/ Peter Dahl would've been > 350 USD + shipping. Fortunately it turned out that was not the problem but I did sell it at a loss with 80m not working right and told the guy it had a problem. It turned out to be a combo of an incorrect padding cap and a not well soldered ground in the RF section and he had the 80m problem fixed in a few days. It also turned out to have an 'extra' cap somebody had put into the input tuning circuit on 160m that was causing a high input SWR on that band... another cheap fix and he's got it up and running. I'd never run 160m on it so had never looked at that. Turns out those two old 1978 Eimacs can still key down ~1400W out. I'm glad for him. It cost me about 300 USD to run it for a couple years at a time when I couldn't have afforded anything more than a $650 amp.

BTW, Anybody need a brand new, still in the box, pair of 'RF Parts' brand (3yr) matched 3-500Z tubes? Or a single and I'll keep one as a spare for the ol' AL-80A.

Again, Thanx Dean

Bill,

Usually I stay silent. But I can’t help myself on this one.

I do not own a Bird nor do I wish to own a Bird wattmeter. From experience on using Bird’s to calibrate our RF generators I would definitely select something like a PowerMaster or LP-100.

We used to get tired of how out of calibration we found new slugs. +/- 20% and worse was not uncommon. We provided Birds as an option is the reason we bought them by the box.

We used a calorimeter for calibration of both the meter dial and the slugs. Once calibrated and installed a new calibrated meter face we taped the slug in place. And marked the frequency on the case. Mostly used at 13.56MHZ. I forget if it was every 6 or 12 months we would do another calibration.

My point – because it says Bird it does not mean it is calibrated. Maybe they have improved over the years.

By the way we checked an old Drake L-4. It was surprisingly close to actual on 20M.

I concur with your other points.

73,

N2TK, Tony

The LED "wattmeter" built-in to my Acom-1010 is not at all accurate, nor do I expect it to be. I find it to be at least 10% generous, perhaps a bit more, but for it's intended purpose as a "relative" indication of power output, it's fine. If I want to know exactly how much I'm putting out,I'll look at the Bird. With a 2.5KW slug that puts the meter reading near the center of the scale, the point at which it's accuracy is referenced.

Finally, the difference between 1200w and 850w is 1.497 dB (OK, let's call it 1.5). On the other end of the QSO a 1.5dB difference in signal strength is not measurable, period. If you want to impress the Op at the other end, put up a better antenna.

NP Skip

I've had only excellent service from Array, Acom Int. and Acom Bg so no complaints there. I just reckon that you don't want to be the guy with a busted transformer. Even replacing a couple boards on the other unit didn't come close to the cost of a transformer. It's even worse than replacing the tube but of course nothing happens without it.

And yes I reckon it wasn't the load at the time so all those years of high temps and high humidity must have taken its toll.

In fact as I think about it now I also had a couple FT1kmp's and eventually when they failed, I was told that their fan(s) contributed to the problem by directing the (moist, humid) air over a part of the RF Unit Board while air was only required by the PA Unit. The tech built some protective ducts to shield the RF Unit while deflecting the air towards and into the PA Unit.

This memory makes me realise that on the failed A1000 I did have the extra fan running continuously. This obviously increases air flow and (on reflection) may have accelerated the problem. My other older A1000 did not have the extra fan fitted and its transformer is still doing well. Can't conclude the fan contributed of course but its something to consider. It's not really essential but at the time I just figured the more the merrier in terms of air flow.

I will disable that fan and try to get a sense especially when running rtty if I can do without it.

Last October, Mike VP8NO described installation of an external fan for his 1000.

Was curious whether any others have been installed - I'm seeking info on where the 12 or 24 VDC is taken from. Inside the amplifier? External power source?

BTW, have not had an ounce of problems with my 1000. Work CW only and usually keep it under 350 W.

Thanks and 73 - Jeff K7JF

Hi,

The 24V is taken from an orange terminal block adjacent to the LV transformer. It's marked 24V. If you would like a jpg I will send one direct along with a drawing showing the fan installation and mini description of the job. Total about 50KB.

However, in your case I would suggest it isn't required unless you are hot, high or both. I installed the fan because I had been running 6m EME JT65A at 900W. 50 seconds TX 70 seconds RX for skeds of anything up to 40 minutes. The tube chimney temp stayed below 80C and the blower never speeded up but I wanted to push a bit more air past, you guessed, the transformer and associated electronics! I haven't run like that since I did the job so I can't compare chimney temps.

I also do RTTY and it usually develops into a run for an hour or more at 600-700W.

The extra fan does add somewhat to the noise. Not a big deal for me 'cos I use headphones all the time, Yamaha CM500 as loved by K3 owners.

Regards,

Mike VP8NO

Just for the record the NEW price on the 1000 is now is $2749. so the euro and dollar are doing that dance again, there have not be many xfmr failures except for one posting on e ham and many Acoms have been used on DXpeditions with radical voltage mains. Your array solutions may be out of calibration plus the antenna you are loading into may have some reactance which would change your power reading, low swr is BS and the only way I have done accurate power measurement is threw a calibrated meter such as a bird 43 to a dummy load that will handle the power, many different antennas that show a low swr may not show a perfect 50 ohm load like a dummy load will.

Tubes are now $650 a pair plus shipping. I always over pay to AS. Jay said he would pick out "some nice ones for me". Ha, one had a flat on the cooling fins (as in maybe dropped) and both kinda ugly which is normal I guess. I figured they were warranted so I installed them both and they both tested fine. The exhaust temp and filiment draw matched up very well. Just a little harder to drive than the "new" original tubes but I left them in to make the long haul. Top end power out is about the same I'd say. 2K plus into a dummy load. I feel like I just got out of the doctor's office. My butt still hurts from the shot but I feel better now with a good set of spare tubes on the shelf.

The external fan is basically not really necessary unless you are actually doing full power, 100% duty cycle AND for extended transmissions - like transmitting an ARRL-type bulletin.

Having said that running rtty contests with a pair of A1000's with one having a fan and the other not, the tube temperature was always much cooler with the additional fan. Sometimes it was so cool, I would jokingly wonder if I would get full output at so low a temperature. Speaking from memory at the moment but there was easily a 15 degree (Celcius) difference when running high power and I seem to remember it being even more of a difference after both amps had been at rest for an extended period.

I had bought two fans with the intention to run both on fans but having installed the first fan, I was waiting to have another reason to open the other amp as it did not seem worth it to go through all that work only for the fan mod.

Just some more perspective on the A1k and fan mod. Hope it helps. Of course 8P is somewhat hotter than most US States.

AB4VV,

While I respect your right to express your opinion and vent your dissatisfaction, you'll get no sympathy from me. Acom and Array Solutions are top notch companies, proven customer service and satisfaction over the years. Just check out the hundreds of reviews on various ham radio websites. By the way, I have no affiliation with Array Solutions, but I do have an Acom 1000, purchased from them.

Your rant on pricing differences has no validation. I was in the retail sector for over 40 years, and when it comes to product pricing, there are no guarantees, especially after FIVE YEARS. There are many forces that affect retail prices....changes in manufacturing costs, distribution expenses, currency fluctuations, competitive issues, inventory control, relative value to similar products, etc. You buy a product at a certain time and price based on your research, desire to own it, and ability to pay for it. After that, all bets are off...buyers remorse and a later lower price (unless there is a "low price guarantee" in place) are not the responsibility of the seller. In fact, look now at HRO and Array Solutions...the Acom 1000 price has increased to $2,750.

You're afraid to use the amp for fear of losing the transformer? C'mon....I guess you don't drive your car for fear of losing the transmission; don't turn on your air conditioner for

fear of losing the compressor. Stuff happens. Anything made by humans can fail for any reason at any time. That's why they have warranties to protect you for a reasonable amount of time. After that, it's your choice to repair or replace, at your expense. The only "lifetime warranty" is if you die before the original warranty period expires :-)

You think GU74B tubes are cheaper to buy on EBay?...so buy them there. Nobody's twisting your arm to buy them from Array Solutions.

You've never seen 1200 watts from an amp advertised and rated at 1000 watts?...not even gonna go there. I "can" get 1200 watts out of mine, but why? Only 850 watts on 40 meters?...too many factors and variables to support that. No one on the other side could tell the difference anyway.

You sound so dissatisfied, I think you should sell the amp while the retail price is now higher, and re-buy your coveted Ameritron AL-80B. You'll even have money left over to sooth your buyers remorse. Just make sure you shake it first to make sure there are no components or hardware rattling around inside.

Just my opinion on your rant.

73 es GL,

Bob K7JQ

Recently purchased the ACOM 1500 and after reading an article on the ACOM 1000 by N1SU I understand that you can configure the ACOM 1000 to automatically energize the rest of the unit on key-down from the exciter without having to press the ON/OFF button on the front panel. Nice feature...curious if the ACOM 1500 can also be configured to do the same. I've checked but do not see that option in the menu selection.

Thanks,

Roger/N5IFH

Never heard of this either. Perhaps you are referring to the "auto-operate" option, which automatically places the A1000 into "operate" after the warmup period. Normally, it goes to "standby", and you have to manually press the button to put it into "operate".

N1SU’s description is not correctly stated.

Neither the 1000 nor the 1500 will do what he says.

You can, however, configure either the 1000 or the 1500 so that it goes into operate mode after you press the ON button on the front panel and the amplifier goes through the required warm-up period.

This only removes the requirement to manually shift into Operate mode from Standby.

Topic: 6533 Message: 6533

I am the proud owner of a brand new Acom 2000a and am trying to get it all set up.

I use an Icom 756 Pro III as the exciter. I control the Pro 3 by computer, so the CIV jack is already in use.

I made the special CIV to CAT cable from the amp manual and intended to use a Y splitter plugged into the CIV jack to feed the CIV voltages to both the amp and the computer. When I do that, however, computer control ceases and the amp doesn't seem to know that the Icom is there either (I have selected Icom in the amp's CAT menu and my Pro III is set to 19,600 baud as the amp manual specifies). Plugging only the amp into the CIV jack of the Icom, the amp still does not seem to know that it should be communicating with the Icom.

Since I was very careful as I made the special CIV/CAT cable and I tested it as best I could before putting it to use, I suspect that the issue is the hex address. I am using the default 6Eh for the Icom. Nowhere in the Acom manual does it say what CIV address the amp is using nor how to change it. If it's listening on some other address, it won't "hear" my Pro III even if everything else is set up correctly.

Anyone have any suggestions on how to hook up the Icom CIV to both interface with my computer and also the amp? Yes, I know it's not necessary and that the amp will change freqs as soon as I transmit, but I think I will improve the longevity of the amp if it pretunes to the rig's frequency as the rig QSYs, without having to transmit into the wrong settings, even momentarily.

I welcome your suggestions. Thanks. 73, Doug W7ZZ

6534. RE: [acom-list] Hooking Acom 2000a up to Icom 756 Pro III

Doug,

I had the identical problem when I tried to connect my IC-7800 to my then-new ACOM 2000a almost exactly 1 year ago.

I do not know anything about the 756 Pro III, so you need to translate what I am going to now tell you about my IC-7800 and the ACOM 2000a interface.

Initially, I plugged the ACOM 2000a CIV cable (the one you made up per the ACOM 2000a manual) directly from the ACOM 2000a RCU to the IC-7800 “remote” jack, with no other device (e.g., a PC) connected.

Next thing I had to do is set the IC-7800 CIV baud rate to 19,2000, (likely a typo in your post, but verify that setting).

As you encountered, that configuration did not work for me either(!)

Then, I had to change the IC-7800 CIV TRANSCEIVE ON/OFF to TRANSCEIVE = ON. [Note: this “Transceive” control has nothing to do with the radio as a transceiver.

It has to do with setting the IC-7800 to broadcast (“broadcast” is ICOM terminology for a particular ICOM CIV command) on the CIV bus the radio’s main tuning dial frequency whenever the IC-7800 changes frequencies. The ACOM 2000a is constantly listening on the CIV Bus for CIV broadcast commands and responds to them appropriately.]

Changing the IC-7800 to TRANSCEIVE =ON fixed the problem and the ACOM 2000a then tracked the IC-7800’s frequency changes.

NOTE ALSO: The ACOM 2000a must be in OPR not STB for the ACOM 2000a to respond to the frequency changes.

Then, I checked out the ACOM 2000a “TUNE” command on the RCU to see if the 2000A would control the IC-7800 RF power output and automatically tune-up the 2000a when the TUNE button was pressed – YES, it worked fine.

--------That completes my answer to your posting----------

Now, there was much more I needed to do to get the ACOM 2000a to work with a PC running N1MM and the IC-7800, all connected to the CIV bus simultaneously, but I’ll

stop typing now and leave that to another thread.

Bill, N3RR

So close and still no cigar. I thought this string might finally get my ICOM 7600 to talk to my 2000A. I double checked the settings per the N3RR email-(nice catch with that "transceiver" broadcast input ,thank you). Nope. Cat cable is correct from ARRAY,(A 2K 1 CV) 19200 is set, "transceiver" was set to ON, ACOM is set for ICOM, set for CAT cable, right plug used on the RCU, all for ZIP.. All I get by changing bands on the ICOM is the 2000 RCU jumping to 13600--13700 segment...and where THAT came from I have no idea. Anybody solve this 7600 to 2000A shotgun marriage? JIM K8JRK

Hello Group

I don't have the 2000A, but the ACOM 600S and my question is have you tried a slower transfer rate as in 9600?

I have my IC-7410 hooked up and one of the settings on the 600S was to set the CAT to TTL and it suggested 9600 baud rate for the ICOM. I don't know if that is an option just trying to help as I know the frustration when trying to get all to work.

The first step I tried was getting the radio to talk to the amplifier in making band changes from the radio prior to going to control from in my case a Mac? The transceiver was talking just fine and followed the band changes with no issues, but he computer was a little more.

I see you have turned the Transceive to "On"?

One final note that I found if you are connect to one of the new USB 3 ports that the Silicon Labs bridge didn't work and I had to put an old USB 2 hub in and after that all came up singing.

I know we are talking apples and oranges, but just trying to help.

The Acom 2000a is hardwired for 19,200 with the CAT set for ICOM.

The CIV device speed that talks to the 2000a must be set to 19,200.

Been there, done 9600 – NG.

Bill,

First, thanks for the detailed reply. I also note that you replied directly by email as well, and I'll respond to that one there.

Thanks for the tip on using "transceiver on/off" as a way to test the home made cable and the system overall. I'll try that. If it works, I know I made the cable correctly, anyway. The wire coming from the mini-plug used for CIV is so thin that I know it broke the first time I put the cable together (testing showed that, so I re-made it, but that doesn't mean it hasn't broken again while in use).

However, all logging software that I am aware of (I use DX Lab Suite) won't work correctly with "transceiver on." You must use "transceiver off." Same for N1MM+, which I use for contest logging, so this won't work for me. In addition, I am soon to add a Steppir antenna which also needs to tap into the CIV output to know what band/freq to tune itself to, so the problem is going to get worse, not better. I had intended to use a 3 way "Y" splitter cable, assuming that the Steppir and Acom 2000a only "listened" to the CIV bus, so would not interfere by sending to the bus, but apparently that isn't the case.

I am exploring other choices. If push comes to shove, I'll let the Acom 2000a sense the transmitting freq and make the change and retune by itself. I just don't like that idea because, by definition, for however long that takes (1 second or less, they say), the amp is firing into a gross mismatch for the tubes and, over time, that just can't be a good thing for the tubes and the amp. I'd really prefer that the amp follow the rig and retune BEFORE I make the actual decision to transmit on the new frequency.

73, Doug W7ZZ

This is mainly in relation to the addition of a steppir to a scenario involving an a2000 and an ICOM rig. At that point it might be worth having a look at microHAM devices like the micrometer or station master.

I use these and even though I do not have an ACOM 2000 or a steppir it does support both devices and can speak to them in either C-IV or other "languages" so with my setup its like middleware between all the stuff we like to interface including rotors, amps, any supported transceiver, antennas etc.

Its obviously not a cheap option but it seems to me everything else isn't cheap either.

Its just a thought on one interfacing option. I'm not an ICOM user (last Icom was a 735) but am a bit wary of the C-IV interface as it seems to have well documented errors/problems even though I am not sure if that is relevant to the issues at hand.

Cheers.

6541. (LONG) SOLUTION For Hooking Acom 2000a up to Icom 756 Pro III, IC-7800 and (probably) the IC-7600 & other ICOM gear (L O N G)

Yahoo group: acom-list (2010 — 2016)
Date: 2015-04-30 05:00:27 UTC
From: Bill Hider
Topic: 6541 Message: 6541

Very good Doug ☐ I am using a device that solves the Acom 2000a problems I had ☐ read on. (LONG)

First of all - full disclosure - I have NO financial interest - NONE - in anything I mention below.
My only interest is as a customer, technical analyzer, beta-tester and user of the K9JM CI-V router.
Further, my interest is in helping others improve their station's operations.

I have been using the K9JM Arduino-based CI-V router since 2011.
EXECUTIVE OVERVIEW & BOTTOM LINE: I believe this router will solve the problems you are having.

History:
(Note: SO2V = Single Op Two VFO, SO2R = Single Op Two Radio)

I purchased my first K9JM CI-V router in 2011 to solve the well-known "PW-1 collision problem" in my SO2V station: IC-7800/PW-1
There are several other hardware & software solutions to the PW-1 problem. I decided to purchase the K9JM solution.

In 2013, I purchased another K9JM router for my (IC-7800/PW-1)*2 SO2R station.

In May 2014, I purchased two ACOM 2000a amps from Array Solutions. The two Acom 2000a amps replaced my two PW-1s, which I sold.

The K9JM router plays "traffic cop" between the PC (running N1MM in my case), the radio (IC-7800 in my case), the Amp (now, Acom 2000a in my case), and one other port (which I do not use).
It solves the "CI-V Transceive ON" problem you noted when using N1MM.
It probably solves your need for another port for your Steppir because it has 3 isolated CI-V ports plus the PC port. I don't use that 3rd port, so I can☐t be sure about it connecting to the Steppir.

I encountered the very same problems with the Acom 2000a as you and others have reported here.
Having paid for and was using the K9JM routers, I asked Jim, K9JM, if he had a solution for the problems that I and many of you here have been having getting the ACOM 2000a to work with ICOM gear (the CI-V bus).

There is lots of technical detail that I could write now about how the router solves all the issues, but way too much to type here.
It's all described in the User Guide, more on that below.

The K9JM router accepts all inputs from the devices, passes on commands to the correct device - in the format they need,
and keeps track of everything. For example, because Acom 2000a needs the CI-V Transceive= ON in your radio,
the K9JM router sends that command to ACOM, but not to N1MM, making N1MM think that the CI-V Transceive = OFF in your radio.)
And the K9JM router does so much more...

I worked with Jim for the past year as beta tester on several modifications to Jim's router for the Acom 2000a.
It's all described on his website home page:
http://k9jm.com/CIV_Router/CI-V%20Router.html and in the User Guide.

There's a link on Jim's home page to the User Guide which describes the operation of the router and on page 44, you'll learn more about the Acom 2000a interface.

Obviously, this is quite a detailed issue to describe in a posting on a user group. And I didn't want this to be like a sales pitch - I am obviously a satisfied customer.
But, this is SO powerful a solution for the ACOM 2000a to interface with ICOM radios, I wanted to get the word out.

I will be around to give you my input, but I suggest you start with Jim's website & the User Guide.

73,

Bill, N3RR

Bill,

First, thanks for taking the time to respond to my inquiries, both on and off line, and especially for this last long, thorough response. It is appreciated.

Second, I have been communicating off list with K9JM and have become convinced, without your most recent endorsement post!, that he is the way to go. Indeed, I have ordered his Acom adjusted CIV router tonight.

His router will solve my problems, both near term and long term. It will hook up the Icom (in my case Pro 3) to the computer, the Acom 2000a and a Steppir, my dream combination. His system uses CIV Transceive On for the Icom, probably what the Icom engineers contemplated to begin with, blocking the "transceive" messages when they are sent to the computer, such that DX Lab Suite and N1MM+ will not be "upset" by receipt of transceive messages that they don't want or like. In other words, it sounds like I can have the best of both worlds. The Icom, Acom amp and Steppir will all be in communication with one another and the computer will also be in communication but not receiving messages it doesn't want or need. The Acom amp will even control the Icom Pro 3 for autotune. What a plus!

I will throw in that Jim K9JM has been emailing me at an incredible rate ever since I first contacted him. I don't think I have ever received better service from anyone, especially considering that I hadn't actually bought a unit from him at the time!

Bill, and Jim, thanks again. I look forward to putting K9JM's Acom modified unit into service in my shack. I will file an updated report after having done so, to let everyone know if this works out as well as I think it will.

73, Doug W7ZZ

6547. ACOM 2000A Connection question

HELLO

I AM BX4AL. I have Connection question. KENWOOD TS-850 Connection ACOM 2000A.

https://www.asuswebstorage.com/navigate/s/6306D2B8B3C3442B8B714056A6C22783Y
https://www.asuswebstorage.com/navigate/s/6306D2B8B3C3442B8B714056A6C22783Y

Circuit . universal low power NPN transistors . (Do not know the transistors model).....?

Whether can use C1815 transistors......?

THANK YOU BX4AL TONY

Hi Tony,

2SC1815 is 50V 150mA NPN transistor.

@5V with 10 KOhm collector load max iC will be 0.005 A so no problem at all.

73
Bill
G4WJS.

Hi Tony,

50V transistors are fine to use for this application, I only mention the maximum voltage and maximum collector current because they are the limiting parameters in a switching application like this.

I calculate maximum collector current with Ohms Law with 5V across a 10 KOhm collector load:

I = V / R = 5/10000 = 0.005 A

which is safely under the 150 mA maximum for the device.

This past weekendas our contest club was working the 4 QSO Party Contets I noticed my Filament light was flickering and since this amp is less than 5 years old I knew this was not the problem seen by early ACOM 2000 Owners where the connectors sending power ot the tube filaments were burning up.
I did recall a friend operating in Carribean that had a high line voltage that caused the filament error light to flicker.

I measured the mains with a lab calibrated Fluke DMM and read 240 VAC but the amp was reading 256 VAC at it's contro; head and I checked another ACOM 2000 in shack and it read 242 VAC plugged into same mains receptacle.
I think there is a way to calibrate what the ACOM 2000 sees and send to Control panel.

Anyone have the procedure ?

Hi Dennis

I understand your problems with your 2000A as I have experienced the same problems about a year ago. It started out as the flickering filament light. My line voltage was in the 240 VAC area and the amp was reading it as approximately 255 volts. The situation degraded over a couple of months and finally the amp would fail every time on startup at the 137 second mark with the display reading "Heater Current Too High 4.3 A".

At the time, I received technical assistance from the factory and from Array Solutions. I was very satisfied with the technical help provided by both parties.

After review, I believed my problems were related to degrading electrolytic capacitors in the analog to digital conversion instrumentation section of the amplifier or a bad trimmer potentiometer. At the time I opened the amp up and checked the caps in situ and did not find any that indicated high ESR with the instrumentation that I have on hand. I also did not find any bad trimmer pots.

I did a kludge repair by following the instrumentation alignment procedures supplied by the factory and adjusted the main A-D span, incoming voltage monitor and heater current monitor to bring the readings within spec. The amp worked fine all last winter through a bunch of contests, but is now back at the startup failure point again.

Once I get some time I will put the amp back on the workbench with the resolve to fix it right this time. At the moment I am sourcing some spare tubes so that I can confirm that it is not actually a bad tube problem.

If you decide to tackle your problems yourself please take care as some of the voltages in the amp can be lethal and you must put safety first. If you do get it repaired please share the solution so that I and others can benefit from your experience.

I can share my technical information on the amp with you if you need it.

Thanks Tony.

Incidentally, I'm thinking of placing the amp in a barn next door along with a DX Engineering coax switch.

I'm worried about the fact that the temperature range and the general humidity variations might not be good for it. I mean it's an old barn - but with a new roof. No heating, nothing.

Well, cold shouldn't be an issue. But humidity and high heat could be an issue. Also dust.

Consider adding the external fan with a good filter on it. I cut mine out of furnace filters and change twice a year.

Dust isn't too bad since the barn is WW2 vintage made of concrete, steel and brick. Some holes here and there but almost weather proof, certainly good enough.

It's the humidity and cold that worries me in the winter.. Won't the internals corrode? I sometimes wish I had taken more notice of my elmer!

Furnace filter.. We don't call anything in the UK a "furnace". We do have central heating boilers, mostly powered by gas. Is that what you mean? I see there are air-con filters available. I'll buy a couple.

Finally, what's you opinion of dust getting in the top of the tubes? That's probably the killer for me.

BTW, the only reason I'm relocating the amp is that the shack is only 7 feet x 8 feet and set up for two of us. The Acom would heat us up too much. Need it out the shack.

If anyone else has ideas, feel free to poke me.

Callum.

Callum,

The air filters I am talking about are used over here to filter the air as it is circulated through the house.

If humidity is high things inside will corrode. Here in New York we don't need to worry about humidity in the winter. But in the summer the humidity gets very bad. Air conditioning in the house and a dehumidifier in the basement keep it to a tolerable level that doesn't corrode things.

Take two pieces of paper that cover the tube exhausts. Tape on one side to hold the paper in place. When you turn on the amp the air will push the paper up to minimize interference with air flow. When you turn off the amp the paper will go flat covering the exhaust holes.

How about some tumble drier or kitchen extractor duct over the tube holes connected to an extractor fan. Draw the heat outside or maybe out of the room into the rest of the house.

At the old hf TX station here two of the 7.5kW amps were ducted outside but the ducting had a flap that could be opened to block the duct and allow the hot air into the TX hall when we needed extra heating in the winter. On one occasion one of the ducts was carelessly left through to the outside overnight when the station shut down and we had high wind and snow. The snow packed into the tube chimney. That caused some long delay fault issues.

Regards,

Mike VP8NO

<acom-list@yahoogroups.com> wrote:

How about some tumble drier or kitchen extractor duct over the tube
holes connected to an extractor fan. Draw the heat outside or maybe out
of the room into the rest of the house.

At the old hf TX station here two of the 7.5kW amps were ducted outside
but the ducting had a flap that could be opened to block the duct and
allow the hot air into the TX hall when we needed extra heating in the
winter. On one occasion one of the ducts was carelessly left through to
the outside overnight when the station shut down and we had high wind
and snow. The snow packed into the tube chimney. That caused some long
delay fault issues.

Relocating to a barn... ?? I'd think the humidity would kill it within
a few of years.

1) http://en.wikipedia.org/wiki/Furnace#Forced-air

2) Why not just vent the amp's exhaust out of the room using some dryer
hose (http://en.wikipedia.org/wiki/Clothes_dryer)?

http://www.homedepot.com/p/Dundas-Jafine-ProFlex-Dryer-to-Duct-Connector-Kit-TD48D2DZW/202449695?cm_mmc=shopping-_-googleads-_-pla-_-202449695&ci_sku=202449695&ci_gpa=pla&ci_src=17588969&gclid=CjwKEAjw1KGqBRC55bru-sa7zCcSJAAxsBf5B6wAgpJKEu0laFnLnOjgC-c8po1MG3kjk5kgdyYnVxoChvbw_wcB

Maybe adding a exhaust fan to it
(http://www.homedepot.com/p/Suncourt-Inductor-4-in-In-Line-Duct-Fan-DB204/100073963).

The mains adjustment is a screwdriver adjustment.
Take front panel off and find the silkscreen for the Mains Pot. Adjust it down. The filament measurement is also a screwdriver adjustment on another silk screened pot. But it is recommended to actually measure the filament voltage to know what you should adjust it too. I have a procedure with pictures to show all the interface card adjustments.

A few things...

1) The relocation to barn (due to heat) I thought WAS the original topic of control lead length.

2) Callum, I didn't see all the responses that were so close to mine so if I seemed to be "piling on" my apologies.

3) Callum, One other option might be to relocated the A-2K to my house in exchange for my A-1K into which I'll drop a few desiccant packages out of medicine bottles into. ;-)

4) Callum, Wow, What a contrast! TS-990S & A-2K -vs- an FT splatter box & 811As micro grid tubes!

As ya'll say...

This might help: To avoid dust build-up, I use a compressed air pistol and air-spray out any obvious dust particles from the Acoms once a year or so.

In case humidity comes to play, that is a different ball-game as the dust sticks to the fan blades and other amplifier components... These fan-blades and other internal components needs to be cleaned likely twice a year?

I've had only excellent service from Array, Acom Int. and Acom Bg so no complaints there. I just reckon that you don't want to be the guy with a busted transformer. Even replacing a couple boards on the other unit didn't come close to the cost of a transformer. It's even worse than replacing the tube but of course nothing happens without it.
And yes I reckon it wasn't the load at the time so all those years of high temps and high humidity must have taken its toll.
In fact as I think about it now I also had a couple FT1kmp's and eventually when they failed, I was told that their fan(s) contributed to the problem by directing the (moist, humid) air over a part of the RF Unit Board while air was only required by the PA Unit. The tech built some protective ducts to shield the RF Unit while deflecting the air towards and into the PA Unit.
This memory makes me realise that on the failed A1000 I did have the extra fan running continuously. This obviously increases air flow and (on reflection) may have accelerated the problem. My other older A1000 did not have the extra fan fitted and its transformer is still doing well. Can't conclude the fan contributed of course but its something to consider. It's not really essential but at the time I just figured the more the merrier in terms of air flow.
I will disable that fan and try to get a sense especially when running rtty if I can do without it.

<acom-list@yahoogroups.com> wrote:

Dean - 8P6SH,

EXCELLENT summary. Thank you very much for the detail.

Yea, 8 years on a 2nd hand ACOM and an apparently infrequent issue raises it's ugly head, I might be drawn to the same conclusion. I might also think well I'll get a A-1.5K and still run it at the same level as I was running the A-1K but we all know how that can creep up on ya ;-) However, it doesn't sound like the fail had anything to do with the load at the time.

In the past if I got 2~4 years on an older used amp before having to do 'something' I figured I was ahead in the game. A transformer is a biggie though.

I had a LK500-ZC that had at one time been diagnosed as needing a new filament transformer. To replace just that part with the correct Peter Dahl would've been > 350 USD + shipping. Fortunately it turned out that was not the problem but I did sell it at a loss with 80m not working right and told the guy it had a problem. It turned out to be a combo of an incorrect padding cap and a not well soldered ground in the RF section and he had the 80m problem fixed in a few days. It also turned out to have an 'extra' cap somebody had put into the input tuning circuit on 160m that was causing a high input SWR on that band... another cheap fix and he's got it up and running. I'd never run 160m on it so had never looked at that. Turns out those two old 1978 Eimacs can still key down ~1400W out. I'm glad for him. It cost me about 300 USD to run it for a couple years at a time when I couldn't have afforded anything more than a $650 amp.

BTW, Anybody need a brand new, still in the box, pair of 'RF Parts' brand (3yr) matched 3-500Z tubes? Or a single and I'll keep one as a spare for the ol' AL-80A.

Again, Thanx Dean

I just received a new Acom 1000 last week. I noticed the display was nothing like all of the pictures I've seen with the pale greenish flourescent displays. Mine came with a coal black background and bright yellow LED digits. The contrast and brightness controls have no affect that I could tell. However, it is just gorgeous!! Bright, clear, sharp, easy to read digits. Like neon signs on the Vegas strip at night. No moving your head side to side or up and down to get a good read on the displayed digits. I have not read anywhere where and when the displays were changed. Does anyone here know? Vastly better display which eliminates any eye strain. Happy happy :-)

Ira,

Correction on the display. It stays black background with bright yellow letters and symbols even on data screens. Even better.

Yeah, triple protection system is one fine feature. Forgot to switch the band switch a couple times from being too use to an auto tune amp. It just sits there, no faults, no trip out. No power out either, duh!

Haven't tripped it yet but I'm sure it will happen one day. :-(

I have recorded about three or four band segments per band and the tune numbers are so close just going buy the numbers I don't bother to final tune. Forty to fifty in gets me 800-900 out. Made 55 dx contacts the first night and most were first call contacts. No new countries but still fun to get through the pile ups.

Enjoy the amp buddy.

Tom,
LOL yea, I had to go take a double look at my LED, mine too stays black back ground, thought for a minute I might have missed something. I can't recall how many amps I have had, this one is really really a great amp, did look at the 1500 but for the money, I am very pleased.

I run my FT 2000 with the menu at 50 watts.
I get 850 out from the A1000.
I have yet to have to call some one twice, the amp is a
winner for sure. Just sold my THP 1.5, I thought I would miss the auto band change, after a month , nope.
Note:

Hey BTW, you might have found this site, a lot of great information on the A 1000
http://www.gmdx.org.uk/page-1671106

Ira,

Well, maybe lime green. Seems definitely yellow to me but I have old eyes. The "Acom 1000" letters in bright yellow (or lime green) on black background looks so nice I hate to shut off the mains. :-)

It reverses on data screen. Bright background with black letters and symbols. So easy to read. Like it a lot.

I just received a new Acom 1000 last week. I noticed the display was nothing like all of the pictures I've seen with the pale greenish flourescent displays. Mine came with a coal black background and bright yellow LED digits. The contrast and brightness controls have no affect that I could tell. However, it is just gorgeous!! Bright, clear, sharp, easy to read digits. Like neon signs on the Vegas strip at night. No moving your head side to side or up and down to get a good read on the displayed digits. I have not read anywhere where and

when the displays were changed. Does anyone here know? Vastly better display which eliminates any eye strain. Happy happy :-)

Ira,

Some great info on the site you sent. I've seen the page before but it was while searching for general info on the 1000 before I made a purchase. Didn't have the page marked.

Hey, one other question. Have you checked the power readings with an external watt meter? I have a couple of LP 100A meters and both show the output to be at least 10% or more higher than the Acom digital meter. That goes for both the Acom 1000 and the Acom 2000A. Checked with both meters. Both read higher. Going to send them in for calibration. Emailed Larry at LP and he asked me to wait until he gets back from Dayton. Just curious if you have checked yours.

Thanks,
Tom

Tom,
LOL yea, I had to go take a double look at my LED, mine too stays black back ground, thought for a minute I might have missed something. I can't recall how many amps I have had, this one is really really a great amp, did look at the 1500 but for the money, I am very pleased.

I run my FT 2000 with the menu at 50 watts.
I get 850 out from the A1000.
I have yet to have to call some one twice, the amp is a
winner for sure. Just sold my THP 1.5, I thought I would miss the auto band change, after a month , nope.
Note:

Hey BTW, you might have found this site, a lot of great information on the A 1000
http://www.gmdx.org.uk/page-1671106

☐

Ira,

Correction on the display. It stays black background with bright yellow letters and symbols even on data screens. Even better.

Yeah, triple protection system is one fine feature. Forgot to switch the band switch a couple times from being too use to an auto tune amp. It just sits there, no faults, no trip out. No power out either, duh!

Haven't tripped it yet but I'm sure it will happen one day. :-(

I have recorded about three or four band segments per band and the tune numbers are so close just going buy the numbers I don't bother to final tune. Forty to fifty in gets me 800-900 out. Made 55 dx contacts the first night and most were first call contacts. No new countries but still fun to get through the pile ups.

Enjoy the amp buddy.

Tom

Ira,

Hey, I finally saw an ad on DX Engineering site that shows the new display. Also, shows the new price of $2489.95 !!!!! Hope you got the new lower price. I paid a nickle more at Array Solutions. They are always high over there :-) (no offense Jay). I hope he's bringing a good stock of them to Dayton.

Topic: 6576 Message: 6584

Tom,

I did some comparisons with my Acom 1000 LCD readouts vs an Elecraft W2 wattmeter. The wattmeter has a computer program readout, so I actually see digital numbers, not just LEDs. Accuracy of the W2...?? "factory calibrated".
Results (14.020 MHz):

Acom 1000 Elecraft W2

Forward Power 1,001W 1,083W Acom 7.5% Lower
Reflected Power 31W 31W
Drive Power 55W 60W Acom 7.5% Lower
VSWR 1.4:1 1.4:1

I've had my amp for one year, and just got it back from repair (CPU board) at Array Solutions, and they also re-calibrated the meter to their PowerMaster II readings. Before I sent it in, the amp was reading about 6% Higher than the W-2 on Forward Power. Again, I don't know how accurate the W2 is, but I imagine the LP-100A and PowerMaster II are more precision. I've heard from others that the Acom 1000 power readings are a bit "generous", but after the re-calibration, mine went from "generous" to "stingy", according to my W2. Just my findings, for what it's worth.

73,

Bob K7JQ

Bob,

Thanks. I don't know what to think about meter accuracy anymore. I have the Alpha 4510, and a couple LP 100A's. The Alpha 9500 meter is very generous compared to the LP 100A. The 4510 and onboard 9500 meter match up so so. The meters on the Acom 2000A and Acom 1000 are about 10% under what the LP shows. Bought the LP's used so don't know really if they have been "monkeyed" with so Larry will re-calibrate them when he gets back from Dayton. Trying to sell my 9500 because it's been said that I have too many amps. Just sold the Alpha 78 a couple weeks ago along with two tranceivers and I wouldn't want it to be said I have too much money laying around. ;-)

Ira,

I looked at the 1500 too. Too many coins for the bang. I wish they made a manual tune with two Gu74b tubes for that price. I would have gone for that. I already have a healthy stock of good tubes and it would be nice to have a primary amp and backup that take the same tube like the 2000A and 1000. A legal limit manual amp using the same tubes would be worth the $4K I think. Alpha's 8410 is at $5K so it would be very competitive. Be my bad luck Acom anounces one at Dayton this week. :-(

What about: A manual tuned Acom amp with a GU43B tube inside? Discussed this with Acom years ago, it went into a no-go unfortunately. (They have build & tested such an amp!)

Reason: GU43B availability in USA. The tube in the Acom 1500 is more commonly available in their largest sales market (being USA)...

Amp would have been much cheaper too...

Kees,

Actually, the other reason I turned away from the 1500 is the 4cx1000 is getting harder to find (which means more expensive too). Alpha stopped using the 4cx1000 in their 8410 and went to the 4cx1500 over a year ago. While it's not as expensive as the 3cx1500a7, it ain't exactly cheap either. That's why I was advocating the two tube Gu74b amp. The same as in the 2000A. Plenty of power with two tubes. Plus I have two or three life time supply of tubes on hand already. :-)

Out of interest I asked the factory if the new LED display could be substituted for the previous LCD display.

<quote>
The OLED is interchangeable with the LCD. But it is thinner by about 5mm and there will be a gap if fitted to an old front panel. I am not sure, but maybe some drilling and filling may reduce the gap to 1mm.
<unquote>

I've not long ago fitted a replacement LCD, an unheard of failure apparently, so maybe there will be a dusty spare on the shelf if anyone has the same problem. I wonder how much a new FP would cost?

6599. ACOM 1000: PN25 protection code

Yahoo group: acom-list (2010 — 2016)
Date: 2015-05-16 14:28:40 UTC
From: plowpenny@...
Topic: 6599 Message: 6599

I bought the ACOM 1000 from a ham first owner and I am having issues with a PN25 protection code. I have had the amp for months with no issue. The amp was turned off and I turned it on and found this issue. I am not sure what is going on. The amp is less than one year old.

Thanks for any help.

Keith

Keith

I believe PN25 is an indication of screen (grid 2) error. You should probably email Acom for help in troubleshooting. That's what I would do.

Val at Acom is very good at walking you through step by step troubleshooting issues. His email is acom@...

Dean,

Thanks. I was a bit surprised that I got the error as it was not even powered on when I was using my rig.

I was curious if the amp is safe to have inline if you are operating digital modes like JT65.

It probably has nothing to do with it but was curious.

Thanks,

Keith

Diagnosing Acom 1000 faults are very easy to do. There are 2 Excel spreadsheets that explain exactly what the faults are and where to measure all the monitored data. PN25 is a grid current fault after the HV is turned on and PR06 is a plate current fault when the amp enters the operate state. The entire fault code contains all the details of the fault. Entering the entire fault code into the spreadsheet will give you the details. The second spreadsheet shows the voltages that can be monitored on the main (top PCB). This amp is very easy to diagnose.

From: NC3Z
Topic: 6599 Message: 6608

Well after being amp-less after the move to our new NC QTH I decided to order a Acom 1000 from DX Engineering after Bob assured me that DXE is an factory authorized service center.

I have had very good support from DXE, and I have had very good support from Array Solutions also (especially during that very bad experience with SPE amps), but I had to choose one and DXE had a nice Hamvention discount.

When I had Icom equipment before the move I had a couple of PW-1's so we will see how the Acom stacks up. I really wanted 6M as I am stuck on 99 DXCC entities and that is annoying me.

If it's covered under the warranty I certainly don't mind spending $75 to ship it. I'm hoping it's the tube and I don't need to ship it. I sent the codes to Val at a come for his review. I should hear back from Ray solutions tomorrow. The amp was purchased on year ago this month.

6610. Fwd: [acom-list] ACOM 2000A Internal Mains Measurement Out of Calibration

Yahoo group: acom-list (2010 — 2016)
Date: 2015-05-19 22:38:18 UTC
From: Rick ve3mm
Topic: 6552 Message: 6610

Further to my post of May 4 (below), I found some time to take a look at my 2000A.

I put in a fresh pair of GU74b's before I started the troubleshooting process, but the problem readings were still there with the new tubes.

It turns out that a trimmer pot, 'RP2' on the CPU board was the source of my problems. This trimmer adjusts the gain of the op amp buffering the analog voltages on their way to the input of the A-D converter on the CPU board. The pot on my board was unstable.

After replacement of the pot, I recalibrated the span of the op amp and a couple of the analog inputs that I had adjusted during my kludge repair last August.

The amp is humming along again. All readings are within spec. Full output on all bands with about 30 watts of drive.

Nice!

Hi Dennis

I understand your problems with your 2000A as I have experienced the same problems about a year ago. It started out as the flickering filament light. My line voltage was in the 240 VAC area and the amp was reading it as approximately 255 volts. The situation degraded over a couple of months and finally the amp would fail every time on startup at the 137 second mark with the display reading "Heater Current Too High 4.3 A".

At the time, I received technical assistance from the factory and from Array Solutions. I was very satisfied with the technical help provided by both parties.

After review, I believed my problems were related to degrading electrolytic capacitors in the analog to digital conversion instrumentation

section of the amplifier or a bad trimmer potentiometer. At the time I opened the amp up and checked the caps in situ and did not find any that indicated high ESR with the instrumentation that I have on hand. I also did not find any bad trimmer pots.

I did a kludge repair by following the instrumentation alignment procedures supplied by the factory and adjusted the main A-D span, incoming voltage monitor and heater current monitor to bring the readings within spec. The amp worked fine all last winter through a bunch of contests, but is now back at the startup failure point again.

Once I get some time I will put the amp back on the workbench with the resolve to fix it right this time. At the moment I am sourcing some spare tubes so that I can confirm that it is not actually a bad tube problem.

If you decide to tackle your problems yourself please take care as some of the voltages in the amp can be lethal and you must put safety first. If you do get it repaired please share the solution so that I and others can benefit from your experience.

I can share my technical information on the amp with you if you need it.

In case anyone is interested my Acom 1000 has a bad tube. It is funny that this tube only lasted one year. I don't think I did anything too bad to it but nevertheless it failed.

As I am not the original purchaser of the amp the warranty is not transferable. The amp is only one year old but still not covered.

Keith

the error was caused by a katohde to grid short.
This is the most commun fault of the gu74b and other tetrode such as gu84b, gu78b , ...
It happens mostly in the first hours of use, seldom later.
So once a tube is used for one year , it will run for many years under normal conditions such as heater voltage, power output, not overdrive, ...

The cathode is hot and can bent over due to structural faults, it comes then close the the grid mesh and there is a internal short. The amp goes in proctection.

I had once a tube that when I tapped on the amp , that went to such an internal short .... , after cooling down the amp restarted as normal and I could use it that way untill the next vibration.

Dirk,

It is interesting that you mentioned this because I moved the amp back into the operating position and turned on the amp and everything was working fine again. I plan to replace the tube but it appears to be an intermittent issue. Well more properly classified as a failed tube that intermittently operates.

This is not all that uncommon Keith. Nearly all the GU-74bs I'm aware of that have been replaced, and that's quite a few now, were either worn out end-of-life, or had grid shorts. I have a "bad" tube I am holding onto for testing and emergency use. It runs fine for an hour, then faults. If I pull it from the socket hot (not a fun job), it has a low resistance from the control grid to the cathode - on the order of 1K ohms. At room temperature it reads an open circuit like it should and it is fully repeatable. I can leave a VOM on the control grid and watch the resistance go up as the temperature goes down. That's just how it rolls with these tubes....

Since this is not uncommon do people chance buying the cheaper tubes from eBay that ship from Russia or get the more expensive tubes from array solutions (for those that purchase from them).

Just curious. I don't mind spending more for known good but if I can save money that is always cool with me.

Keith

I have bought some nos gu74b on ebay.
From the 6 I tested, all tubes where ok.

You can buy 2 or 4 tubes on the Russian marked agains one
tested from a acom dealer

you can preheated and tested yourself.
there are already more than one item on this forum about this.

Hello all,
I am new to the board and I just picked up a very nice used Acom 1000.
It works great and has full output.
I mostly run AM on 40 and 80.
When I set the load to the center with carrier it looks fine but under modulation the load indicator goes way off to the right on audio peaks.
I run it at about 150 watts of carrier.
Is this a normal operating reading?
Thanks,
Don

Keith,

Can't speak to how reliable those ebay tubes from Russia are but I bought a few and have tried one out. My new Acom 1000 seemed to take a bit much to drive at first. The book says 50-60 watts to make "rated" power. I guess that means 1K. Mine took more like 65-70 watts to make 1K. The bias settings were right on the money and technically the amp did make spec. Val at Acom said that the numbers recorded for that amp do indicate it would take a little more drive than average. Just the nature of manufacturer's variations in the tube. Should last for years but just take a little more drive. So with nothing to lose I took out one of the "cheap" Russian tubes from the ebay buy and warmed it up a few hours and slowly loaded it up. That tube makes 1k with 50 to 55 watts. Enough rf at the top end to put a huge grin on your face. I never run it over 60wt drive because it's in the 1100+ output range by then. If I needed that I would just turn on the 2000A. The 1000 is not just my backup amp, it's my test fixture too. :-) I feel good about the other "cheap" tubes I have. I did already have a spare set of tested tubes from A$. They were of course good. In fact, they are in my 2000 now and the originals that I used for about a week are boxed up as proven good spares. I should have two life times worth of tubes on hand so I don't worry about supply anymore. Besides, they should appreciate more in value than my 401k in the long haul.

Since this is not uncommon do people chance buying the cheaper tubes from eBay that ship from Russia or get the more expensive tubes from array solutions (for those that purchase from them).

Just curious. I don't mind spending more for known good but if I can save money that is always cool with me.

This is not all that uncommon Keith. Nearly all the GU-74bs I'm aware of that have been replaced, and that's quite a few now, were either worn out end-of-life, or had grid shorts. I have a "bad" tube I am holding onto for testing and emergency use. It runs fine for an

hour, then faults. If I pull it from the socket hot (not a fun job), it has a low resistance from the control grid to the cathode - on the order of 1K ohms. At room temperature it reads an open circuit like it should and it is fully repeatable. I can leave a VOM on the control grid and watch the resistance go up as the temperature goes down. That's just how it rolls with these tubes....

Hal N4GG

Dirk,

It is interesting that you mentioned this because I moved the amp back into the operating position and turned on the amp and everything was working fine again. I plan to replace the tube but it appears to be an intermittent issue. Well more properly classified as a failed tube that intermittently operates.

Keith

the error was caused by a katohde to grid short.
This is the most commun fault of the gu74b and other tetrode such as gu84b, gu78b , ...
It happens mostly in the first hours of use, seldom later.
So once a tube is used for one year , it will run for many years under normal conditions such as heater voltage, power output, not overdrive, ...

The cathode is hot and can bent over due to structural faults, it comes then close the the grid mesh and there is a internal short. The amp goes in proctection.

I had once a tube that when I tapped on the amp , that went to such an internal short .... , after cooling down the amp restarted as normal and I could use it that way untill the next vibration.

The tune indicator does indeed wander all over the place with variable amplitude signals like SSB but is steady if using RTTY. Probably to do with the way the data is captured and computed.

There’re no screws to remove on any Acom amplifier to ready them for use.

The 1010, 1000, and 1500 all are ready to be operational as they come out of the box.

The 2000A comes with two plastic spacers on the tubes that must be removed before use. Remove them when you install the power transformer.

George,

I’m strictly talking about the “drop-in” gray plastic spacers that hold the tubes in their sockets for safe transport. If you left these in, you need to remove them. They can melt. I have seen this occur.

In addition, they can greatly impede the airflow causing further overheating.

I’m not talking about the porcelain (or Teflon – in later units) standoff in the middle of the tube. That stays in place.

Tom,

I've only bought 2 of those eBay/Russian tubes (from QRO Parts dot com) and both performed perfectly (after initial recommended 5-hour Gettering process)

Granted, 2 tubes is way too small a sample to make any broad endorsement, but I'd likely use them again.

Shipping info on the packages indicated they came from Sweden. Both were butt-ugly in appearance, but work fine. (these were bought separately and are not a matched pair, bought as individual spares for an Acom 1010). I originally ordered the first one just to have a spare, but then thought... what if I end up needing it? - so bought a second one. Probably stupid, but I doubt their value will ever go down so I can always sell 'em for at least what I paid, esp. knowing that they're both good.

6634. ACOM-1010 Keying circuit current

Yahoo group: acom-list (2010 — 2016)
Date: 2015-05-31 18:13:57 UTC
From: garfieldbill700@...
Topic: 6634 Message: 6634

For the benefit of anyone interested, I just measured the keying circuit voltage and current on my Acom 1010

Voltage: 13.44 vdc (sometimes called the resting voltage (key-up)
current: 6 ma dc

Thus the Acom 1010 can be keyed directly with HF rigs supporting solid state switches that provide 'Active Low' logic on TX, such as the new Kenwood TS-590SG and the TS-990 (both using the RL keying option)

Per info from Kenwood, the solid state switch is rated for 10 ma.and a resting voltage of 15v (or less) * see attribution below

The keying circuit of the original TS-590S only supports 'Active High' logic on the RL lead, thus requiring an external buffer circuit.

Either Kenwood model can also use the built-in T/R relay in the rig (pins 2 & 4 of the 7-pin Remote terminal connector)

* Note - Kenwood maximum keying current & resting voltage figures taken from Rin Fukuda's (JG1VGX) article: "How To Key Your Amplifiers with TS-590(G) or TS-990

Bill,

Do you happen to know the relay pull-in time on the 1010? I have an Icom 7600 driving the Acom. According to the QST review of the 7600, the power output doesn't rise for about 9 or 10 ms after key closure. If the 1010 relay pull-in is less, it means no "hot" switching. A new firmware update for the 7600 provides for an additional 10 ms delay, but I don't want to apply it if it's not required.

Thanks -

Jim, K4HPP

6640. 2000A SWR Fault issue

Yahoo group: acom-list (2010 — 2016)
Date: 2015-06-15 18:11:31 UTC
From: Bdr@...
Topic: 6640 Message: 6640

I have a fairly new Acom 2000A and have been having a recurring but intermittent SWR fault issue. The amp faults, trips off and and indicates >650 watts reflected power in the fault text. In addition, the forward power LED occasionally shows a power spike when the amp is in standby and no RF is flowing through it.

Obviously, I went skulking for an SWR issue. I checked using independent SWR/Watt meters, changed lines, connections, etc. and found no indication of any actual problem. I have a DWM-2 with two sensors (one on the antenna input line and the other at the input to the tuner and both readings are normal low SWR. No radio is indicating an SWR issue. Finally, I put my Alpha into the exact same RF chain, replacing the position of the Acom, and the Alpha indicates the exact same SWR readings as my other instruments and does not fault. This weekend, as luck would have it, I had faulting while I was monitoring SWR and reflected power in the measurement menu on the RCU. The faults were occurring when the Acom measured SWR was indicating 1.5:1 or less and in line with the DWM-2. So, I have no actual SWR issue and even the Acom measuring circuitry is accurately reporting the SWR to the CPU. That seems to rule out any issue with a connection in the internal Acom RF chain. If all this weren't weird enough, the Acom is not recording these SWR faults in the "last 10 fault" list.

II believe some component is failing on the CPU board. Has anyone else seen this issue? If so, what was the resolution. Thanks for your time.

Brent WA0VY

Hey Brent,

Regarding your SWR-fault, what kind of coax are you using to your antenna?

If it is small diameter foam-type (i.e. LMR-240 or RG-8X) , you could be getting an intermittent voltage arc from the center-conductor to the braid. I have heard many instances of this happening with linear amps and foam-dielectric coax, esp. where sharp bends or tight-ties have deformed the coax.

Power-handling ability (current) and voltage-breakdown of foam coax are two very different things!!

Jay, thanks for the reply. I use Andrews/Commscope LDF4-50b and FSJ4-50b Heliax with N type connectors. As mentioned, no instrument shows an SWR issue, not even the Acom. No issue with Alpha at full power either. I have even taken switches out of the RF chain. I've definitively ruled out an actual arc or SWR issue anywhere on the RF chain (and also, I believe, internal to the Acom itself).

However, the Acom still faults.

Brent,

You do not mention if this problem is antenna or frequency dependent so I'll suggest all the below items:

Have you tried:

- Testing the amp into a dummy load?

- Testing on other bands?

- Re-doing the auto tune procedures on the band(s) and/or antenna(s) where the problem is present?

- Re-doing item 3 above into the dummy load and trying item #1 again.

Brent - that's good advice from Bill, N3RR. I had issues similar to yours - 80M only - and after serious headscratching I did the band segment tuning procedure (in the manual) and the issue went away and it has been smooth sailing since then. If you haven't tried that, see what happens. 47 and 73, Vic, W4VIC

The symptoms might point to a CPU problem, but before I would go there, I would check the basic SWR Reflected circuit, starting with the adjustment resistor, RP5 on Page 3 of the Interface section of the schematics.

I agree that this should also be tested on a dummy load, since the next thing that come to mind is some sort of external RF getting into the antenna and tripping the SWR Reflected circuit. Are you near any high-power RF sources, such as a cell or broadcast site? It's quite possible that a static discharge could also cause the same problem since the SWR circuitry is not particularly frequency selective. Adding a low-pass filter to the output might be a good solution if this is the case.

All good ideas and I appreciate the help. However, there is no other RF source out there in my area and remember, the SWR measurement present in the Acom measurement screen is normal when it faults and consistent with all other measuring devices (3 in all on the line and none of them see any issues.). The Acom has a separate measurement board and if it is indicating no problem, as is every other measuring device, then an SWR fault has to be a figment of the Acom's imagination. I'm thinking HAL 1000 from 2001: "I'm sorry Dave, I'm afraid I can't do that."

Yup, did that when I reset the RCU and lost all prior settings. In addition, every time I had a fault, I retuned at the problem frequency. Made no difference. Someone also asked if it was frequency or antenna related. I only actively use one antenna and this occurs most often on 17, but not sure it hasn’t also happened on 20. It has never happened on 40 and the Acom has been well used on 40. 15-10 have been so crappy lately that I haven’t tried on those bands.

Brent,

Sounds like you've ruled out the RF chain and isolated the problem to the amplifier itself. Have you opened the 2000A and inspected it for damage? Mine was banged around enough in shipping that the ceramic forms for the tank circuit coils had broken away from their bases and deformed the turns somewhat. I've never had your problem, but I'm thinking this might be one possible explanation. I could have had similar problems had I not taken the time to re-form the deformed part of the coils and glue the forms back onto their bases.

Hi all.

I have an ACOM 1010 that has been used less than 20 hours. I was so impressed with it I bought an ACOM 1000. Consequently, the 1010 has been in it’s box in a closet. I would like to sell it. a 10 out of 10. $1500

From: Brent D. Rosenberg
Topic: 6640 Message: 6652

I would like to do the same as the Acom is the only piece of equipment I own that uses SO 239's anyway. I have to use adapters to connect to the N type connectors on my Heliax, which is obviously a weak link. I have doubts about whether this could be the cause of my issue since the SWR and reflected power measurements on the RCU are all normal when the faults occur. On the other hand, since there is a suggestion that it may be frequency related (i.e., not seen a fault on 40 ever), it could be the cause. In any event, it would be better plumbing.

The other issue, of course, is whether making the change would void the warranty.

Yup, did that when I reset the RCU and lost all prior settings. In addition, every time I had a fault, I retuned at the problem frequency. Made no difference. Someone also asked if it was frequency or antenna related. I only actively use one antenna and this occurs most often on 17, but not sure it hasn't also happened on 20. It has never happened on 40 and the Acom has been well used on 40. 15-10 have been so crappy lately that I haven't tried on those bands.

Brent - that's good advice from Bill, N3RR. I had issues similar to yours - 80M only - and after serious headscratching I did the band segment tuning procedure (in the manual) and the issue went away and it has been smooth sailing since then. If you haven't tried that, see what happens. 47 and 73, Vic, W4VIC

Brent,

You do not mention if this problem is antenna or frequency dependent so I'll suggest all the below items:

Have you tried:

- Testing the amp into a dummy load?

- Testing on other bands?

- Re-doing the auto tune procedures on the band(s) and/or antenna(s) where the problem is present?

- Re-doing item 3 above into the dummy load and trying item #1 again.

Jay, thanks for the reply. I use Andrews/Commscope LDF4-50b and FSJ4-50b Heliax with N type connectors. As mentioned, no instrument shows an SWR issue, not even the Acom. No issue with Alpha at full power either. I have even taken switches out of the RF chain. I've definitively ruled out an actual arc or SWR issue anywhere on the RF chain (and also, I believe, internal to the Acom itself).

However, the Acom still faults.

As for me I wouldn't bother installing N-type connectors on anything except for my 1.2 Ghz antenna. They are a PITA to put together, plus I've had the center pin retreat a couple times. A good quality PL/SO will be very excellent for all uses below 1.2 Ghz, maybe include 440 too, but that's all I'd bother with. If you use crimp type PL with heat shrink tubing then liquid tape it will be waterproof.

Hello Joe,

You were not the only one who replaced both the SO-239.
If it's possible I replace all the SO-239's on my devices by N-connectors from Rosenberger or Suhner.
Sooner or later SO-239 may give a lot of trouble. I don't trust them anymore.

6656. RE: [acom-list] ARRL Reviews of HF Power Amplifiers publised in QST Magazine

Yahoo group: acom-list (2010 — 2016)
Date: 2015-06-24 18:13:53 UTC
From: Brent D. Rosenberg
Topic: 6655 Message: 6656

While the transceiver graph is interesting and potentially helpful, it does not present all data as apples-to-apples which seems fundamental to good science. The most glaring example of this is the 3rd order IMD data, in particular as to the Yeasu Ftdx 5000 and the Hilberling PT-8000A. The Yeasu 3rd order IMD is stated to be -43 db while the Hilberling is stated to be -26 db, which is an eye-popping, horrific, really, really lousy number. However, the Yeasu number is for class A operation at 75 watts and the Hilberling number is for "worst case, 160 meters" at 200 watts PEP. While not necessarily a fault of the graph, what transmitter nominally rated at 200 watts would NOT show significantly better IMD numbers if de-rated to 75 watts? For that reason, I've always considered that Yeasu Class A claim to be a bit slick.

Further, when you get a bit closer to apples-to-apples, the QST reviews actually note as follows:

Hilberling: 3rd/5th/7th/9th order IMD is "typically -35/-48/-54/-59."

Yeasu: 3rd/5th/7th/9th order IMD "worst case" "HF, 200 W PEP, -30/-48/-46/-47 dB."

No "typical" number is presented for the Yeasu.

The graph also presents some IMD figures with a symbol (~) denoting they are "typical" but then does not present other "typical" QST findings even where they exist in the review (e.g., "typical" numbers are noted in the QST review for both the Flex 6700 and the Hilberling, but the graph uses "worst case" numbers for the Hilberling and "typical" for the Flex [the latter also incorrectly as to 9th order]).

So, is it a fair comparison to use the Hilberling -26 db worst case 3rd order IMD number against the Yeasu -43 db 3rd order IMD number selected from 75 watt class A operation, particularly when the Hilberling 3rd order IMD is "typically" 5 db better than the Yeasu "worst case" number? And why would you present "typical" IMD numbers for the Flex and not the Hilberling when both numbers are present and available in the QST reviews? And lastly, why do you present "worst case" IMD numbers for the Hilberling without even noting that in a footnote?

Fortunately, the amp section offers much more straightforward comparisons and I found that portion very useful.

Thanks Hans. I'm actually a big fan of your blog (even if today it might not sound like it).

Hello Brent,

Many thanks for your comments; I really appreciate this!

I will try to find out why there is a difference in the overview between 'worst case' and 'typical'. If I am able to make a more fair presentation on this item I will correct it.

But first a four days trip to the Ham Radio in Friedrichshafen ;-) We are leaving tomorrow morning.

Thanks again and 73! Hans.

And in fairness, lets take the K3 down to 40 watts and what is the IMD?. I use 40 watts because that is what I drive my amp with. Facts and figures can be manipulated, or shall we say, adjusted?

I cannot claim a tremendous amount of experience with this unit but I have used it and am planning to emply another in a future set-up.

First off this is designed for use by YAESU radios but having said that I believe it has been used with K3 rigs (wityh some modifications to rig and/or unit) but I have not personally seen this setup. It therefore comes from the factory with the necessary 2 cable sets to hook up to any 2 of Yaesu FT1000xx, FT2000, FT9000 and FTDX5000 rigs. (maybe others as well). I have personal experience only with it hooked up to a pair of Yaesu FT1000MPMK5 & MK5Field rigs. In that situation it worked very well and I was impressed.

I believe the main signal which Yaesu has which other rigs may or may not have is the "INHIBIT" signal - so the unit can prevent either of the rigs from going into TX when the other is in transmit and also when the other rig is not in the circuit (speaking from memory here - so subject to correction)

I would be extremely cautious therefore in hooking up dissimilar rigs especially where (to the best of my knowledge) the Kenwood may not have a similar "INHIBIT" signal compared to the Yaesu.

This used to be a pretty unique product but with the evolution of M2 and MM stations a couple other devices have come on the scene which perform the same function but using just about any rig. In this regard 4O3A.com has a somewhat similar product but it is somewhat more generic in its ability to handle most or all modern transceivers - http://4o3a.com/index.php/products/station-automation/lock-x

I'm not associated with either product company - just try to keep up with what is available for station upgrades.

Regards

Dean - 8P6SH / 8P2K

ahhhh, this I know a little about, unfortunately, the unit you have was
designed more for the Yaesu range(and a few others) as I wanted to dothe
same with my IC7850 and TS990 and found out I had the wrong unit for the
job in stock.
Sorry for the bad news, by the way, 1 Acom 2S1 for sale here in Australia
if anyone can use one.
cheers

Hello Brent,

Today I changed the overview according to your comments. Thanks again! I hope this is more apples-to-apples. You will see that I added two figures: Class AB and Class A. And I corrected the 9th IMD of the Hilberling PT-8000A.

http://www.remeeus.eu/hamradio/pa1hr/productreview.htm

In Friedrichshafen I met the men from Hilberling again. We received very interesting information about their new Linear Amplifier; two inputs, four outputs, Pre Distortion. And a bunch of N-type connectors.

I also spoke with the Acom man. Nice to see their two new amplifiers; UFB!

Hello Brent,

Today I changed the overview according to your comments. Thanks again! I hope this is more apples-to-apples. You will see that I added two figures: Class AB and Class A. And I corrected the 9th IMD of the Hilberling PT-8000A.

http://www.remeeus.eu/hamradio/pa1hr/productreview.htm

In Friedrichshafen I met the men from Hilberling again. We received very interesting information about their new Linear Amplifier; two inputs, four outputs, Pre Distortion. And a bunch of N-type connectors.

I also spoke with the Acom man. Nice to see their two new amplifiers; UFB!

'Brent D. Rosenberg' Bdr@... [acom-list] schreef op 24-6-2015 om 20:13:

While the transceiver graph is interesting and potentially helpful, it does not present all data as apples-to-apples which seems fundamental to good science. The most glaring example of this is the 3rd order IMD data, in particular as to the Yeasu Ftdx 5000 and the Hilberling PT-8000A. The Yeasu 3rd order IMD is stated to be -43 db while the Hilberling is stated to be -26 db, which is an eye-popping, horrific, really, really lousy number. However, the Yeasu number is for class A operation at 75 watts and the Hilberling number is for "worst case, 160 meters" at 200 watts PEP. While not necessarily a fault of the graph, what transmitter nominally rated at 200 watts would NOT show significantly better IMD numbers if de-rated to 75

watts? For that reason, I've always considered that Yeasu Class A claim to be a bit slick.

Further, when you get a bit closer to apples-to-apples, the QST reviews actually note as follows:

Hilberling: 3rd/5th/7th/9th order IMD is "typically -35/-48/-54/-59."

Yeasu: 3rd/5th/7th/9th order IMD "worst case" "HF, 200 W PEP, -30/-48/-46/-47 dB."

No "typical" number is presented for the Yeasu.

The graph also presents some IMD figures with a symbol (~) denoting they are "typical" but then does not present other "typical" QST findings even where they exist in the review (e.g., "typical" numbers are noted in the QST review for both the Flex 6700 and the Hilberling, but the graph uses "worst case" numbers for the Hilberling and "typical" for the Flex [the latter also incorrectly as to 9th order]).

So, is it a fair comparison to use the Hilberling -26 db worst case 3rd order IMD number against the Yeasu -43 db 3rd order IMD number selected from 75 watt class A operation, particularly when the Hilberling 3rd order IMD is "typically" 5 db better than the Yeasu "worst case" number? And why would you present "typical" IMD numbers for the Flex and not the Hilberling when both numbers are present and available in the QST reviews? And lastly, why do you present "worst case" IMD numbers for the Hilberling without even noting that in a footnote?

Fortunately, the amp section offers much more straightforward comparisons and I found that portion very useful.

Thanks Hans. I'm actually a big fan of your blog (even if today it might not sound like it).

From: Hans Remeeus
Topic: 6666 Message: 6666

Hello group!

In Friedrichshafen Acom introduced two new Linear Amplifiers; the
Acom2100 and the solid state Acom1200S.

Acom2100:
1.8 to 54 MHz.
Single 4CX1000A tube.
1500 Watt continuous carrier, no mode limit.
IMD: better than 32db below rated output.
13.5dB gain typically.
3500VA consumption at rated output.
29.3kg/64.6lbs.
Virtually silent QSK.
OLED comment display.

Acom1200S:
5" high resolution color display.
BLF188 NXP MOSFET's.
50 Watt RF drive power.
1.8 to 54 MHz.
Remotely controlled by RS232 interface.
93 till 265 Volt.
1000 Watt PEP, of 1200 Watt continuous carrier typically.
IMD3 better than 30dB below rated PEP output.
RF power gain: 13dB.
2000VA or less power consumption at full power.
12kg/26.5lbs.

Expected 2nd half of 2015.

I have photo's and leaflets.

73, Hans.

Interesting question. Wonder if that A2000 is really being challenged in its position. Maybe OM Power has challenged it effectively? But in its price range it's still difficult to beat the A2000. I suspect most manufacturers will be spending more time developing Solid State Amps - which seems to be where the buzz is right now. Companies like Expert Amps must surely be challenging amps like the A2000. What that A2000 has though is a simple and classic design which has been proven in the most difficult situations for over a decade.

We'll see what the future holds.

Chris,

I saw them both in Friedrichshafen this past weekend. Also saw Val, LZ1VB there.

The new Acom 2100 (no "A" following the model # is your clue) is not Automatic.

The 2100 is essentially an upgrade to the 1500 as it is manual tune, but it has the same power supply as the 2000A including the same removable transformer and like the 1500, with a single 4CX1000 tube final. A little more headroom in the power supply.

The 2100, as does the 1500 (which is *not* being discontinued) covers 160 thru 6m.

The 1200S ("S" signifies solid state) is a 1kW solid state amplifier and it also covers 160 thru 6m, and is basically the same as the 600S, but with 400w more - to 1kW output.

Both are new models with the new Acom styling - black anodized front panels - very elegant in appearance.

Both should be available around January 2016.

73,

Bob W5OV

6671. ACOM 2000A replacement battery

Yahoo group: acom-list (2010 — 2016)

From: martins160@...
Topic: 6671 Message: 6671

Well, my 2000A has just informed me the internal battery needs replacing.
This is a 2001 vintage unit with the older style control board.

Does anyone have experience replacing the battery?
It looks like it's soldered in.....ugh....
I'm interested in perhaps changing that to a socket type replacement battery.
I also have no idea as to the battery number...I believe it's a 3v lithium-ion

I'd appreciate any help in this process....from ideas as to what the battery
number is and what I can use in a socket configuration etc.

I will contact Array Solutions Service if no one here can help

Thanks

Martin ka7gkn

Hello Hans,

Still to successor for the Acom2000A. Perhaps there is no need to ;-)
The Acom2000A still is a very interesting amplifier. Actually the only
things I wish, are two inputs and three or four outputs.

Tomorrow I uploaded the two leaflets of the Acom1200S and Acom2100 and
two foto's of them to the files area of the Acom Yahoo group. You
received notifications of them.

Hey John,

I too can only agree with you on the Acom 2000, I am on my 2nd Acom 2000 with the new controller and I just love it. Sure, 6m would be a nice addition but not at the cost of that breath in the microphone band change, its just so quiet and smooth in every way.

Agreed also on Jay at Array Solutions, he helps us heaps down under here in Australia as well, its a great team effort whether it be from Jay or the factory, and like yourself, excited about what happens next of course.

If the 2000 does see an upgrade, wow, its going to be hard to not get in early and have a play,

Acom Rocks, your right, thats a great statement that I just loved reading...Keep up the great work over there in Bulgaria, your setting the standard for the rest of the world to catch up to....

Cheers
Brenton

Pre-distortion!!

Actually a must for every transceiver and power amplifier, when you do SSB.

Please view the two pictures at this site:

As far I know, pre-distorsion is happening in the (SDR) transceiver.
The only think we can do in the amp is to provide an sample output.

Yes, it would be nice if new amplifiers would provide a secondary
attenuated output (~-50dB) for use as a pre-distortion sample input.

Correct. In Friedrichshafen we saw the new Hilberling HPA-8000B Power
Amplifier with such a pre-distortion output. I have photo's of it.

Pre-distortion!!

Actually a must for every transceiver and power amplifier, when you do SSB.

Hans, if Hilberling has added such an output to the HPA, they must intend to use it with the PT 8000A. However, no one mentioned that to me at Dayton and I was embedded with that group for two days. Maybe I didn□t ask the right questions or perhaps the HPA will be released in EU zone before USA. In any event, that is big news.

Hello Brent,

I just uploaded a photo of the connectordeck of the Hilberling HPA-8000B.
Eight N-type connectors; 4 antennas and 2 transceivers.
SMA for the Pre-distortion output.

IMHO this is an excellent example for many other manufacturers of Linear Amplifiers!

Hilberling made this feature for SDR's like the ANAN, not for their PT-8000A. Did you read the test of the Anan-100 in RSGB's Radcom?

I will ask Hans for more details about this feature on the HPA-8000B.
The price is 6k Euro. Available from October 2015. Serious pre-ordering is possible, without payment in advance.

73, Hans.

N connectors?? Why? They are a PITA to assemble plus more expensive plus they are not needed. IF I were buying one of these (which I'm not) I would specify SO-239.
How much is this amp in U.S. dollars?

Dale, k9vuj

A lot of our customers have wanted 6m added to the Acom 2000A so any new model, this would be a great addition.
So far, the Acom 2000A remains the winner over here in Australia for multiple reasons, I would suggest it may be a while before an upgrade is on the cards being that the current amplifier is selling so well. That being said, the two new ones came as a complete surprise so who knows, an announcement could happen in the 2016/2017 years, we keep our eyes glued to the forum, it seems to be a great source of information, even as dealers.
cheers

6706. 4CX1000A vs 4CX1500B query

Yahoo group: acom-list (2010 — 2016)
Date: 2015-07-03 01:52:28 UTC
From: Dean St. Hill
Topic: 6706 Message: 6706

Hi guys

I was wondering a couple things now that Acom has launched another amplifier using the 4CX1000A tube. My queries are really only based on Alpha's replacement of the 4CX1000A with a 4CX1500B in the 8410 amplifier. I am asking for my own knowledge and not to be mischievous in any way.

I wondered basically first IF the two tubes are direct replacements for each other and if so whether there would be any advantage or whether it was even possible to replace the 4CX1000 in the A1500 with a 4CX1500B.

Secondly are both tubes capable of 1500W output with the appropriate power supply or is there any advantage of using a 4CX1500B in terms of design.

Regards

Hello Dale,

Here in Europe there hardly is a difference in price between N-type and
M-type connectors (of good quality). Both cost a few Euro's. Perhaps
because Suhner and Rosenberger are European companies and Amphenol is
US. In Europe N-type connectors are very common and widely used.

Mechanically N-type connectors are better, so are BNC. If installed
correctly, but that's obvious.

Hello Hans,

They are connectors used in UHF and above and outside in the wx. I use them on my 1.2 Ghz antenna and I have a dozen or so in my connector kit, but I just hate putting them together, plus there are several different designs. I just don't think they are needed on the back of a amplifier, it would mess up my whole shack scheme going from PL to N and back and forth.

I have no plans on buying the amp. Just curious why they'd put N's on the back of a HF amp, what-ever.

Thanks for posting the picture and your info about it.

6711. New 1000 finally here

Yahoo group: acom-list (2010 — 2016)
Date: 2015-07-03 12:10:39 UTC
From: NC3Z
Topic: 6711 Message: 6711

What an amazingly quiet amp, when I had an Icom PW-1 I had to remote it to a cubby hole behind the desk to minimize the noise. The 1000 is front and center in my operating desk with no noise issues, and looks very handsome doing so.

Although I may never need them I found two GU74B that were still in a sealed bag and local, and at $130 each I could not resist.

One reason I could think of is the SO-239 connectors (female PL259) on
the Acom 2000A seem to develop a problem over time where the center pins
spread apart and cause intermittent connections with some PL-259 connectors.
I had this on my amp and changed out the connectors to Amphenol brand
chassis mount SO-239 connectors. Nice and tight now :-)

Congrats on the new Acom 1000. I've had a lot of different amps here.
The solid state amps need to move air across the heat sink and can get
very noisy when the secondary stage fans kick in.

I would like the ability to control the tuning memories remotely. That is, if I change from say STACK to HIGH antenna, I would like the tuning memory to change to the HIGH memory location.

Probably needs to be tied in with relays, logic converters, or something.

Dave,
Something else you can do **before** the factory SO-239 connectors wear out is to install a double male together with a double female (Amphenol 83-877 & 83-1J respectively). The "genuine Amphenol" 83-1J will last a lot longer than the cheap Chinese connector plus it is far easier to swap out if the need later arises.

For the cost as well as the perceived quality of a high-end amplifier you would have thought Acom would have used genuine Amphenol 83-1R (SO-239) connectors. It's a small incremental cost that can later lead to problems that otherwise shouldn't happen. Only my 2¢ worth.

My knowledge is dated. However, I'd like to see a simple ASCII command set that permits access to most things. Maybe that has already happened. I never was able to figure out the old system of controlling things over the RS232 connector. Tried pretty hard but ended up with no joy and lots of infinite loops.

For example,
I was never able to tell the amp to change from ANT X to ANT Y for a particular segment (that was to allow for things like your stack or different antennas for same band). The tunings would needed would go with the antenna.

It would also be great to permit analog inputs for things like antenna selection/ segment -- like an external A/B switch or BCD. I'm guessing most of us have non-ACOM antenna switches and selection schemes that don't interface well (or at all) with the 2000. The ACOM needs to get this info somehow.

Hi Bill

Yes, that would be fine on a new amp but I bought mine used and it was four years old at the time. Besides, I had the Amphenol so-239 connectors left over in my connector box from back in the Motorla shop days.

I bought a spare set of tubes from Vine in England and they are equal to the originals. Murphy's Law - if you have a spare set, the tubes will not fail!

I've had a bunch of different auto tune amps, Quadra, PW1, three 9500s, and the OM2500A. The Acom 2000A is my favorite. Good power out and very quiet compared to the others, even quieter than the 9500.
Using it with the Flex 6500 and DDUtil makes it truly automatic with the Palstar AT Auto. Switch bands and the tuner (if needed on that band) and amp already QSY before the first dit is sent!

Tom, why not use Antenna Master by WC1M like I do. It has a great interface to the ACOM and automatically tunes the ACOM for the antenna setting you choose.

From: Hans Remeeus
Topic: 6726 Message: 6726

Dear groupmembers,

Today I received the digital QST issue August 2015, so I could add the
*Acom 600**S* in my overview.

I also added two new columns: 'Driving Power' and 'Output Power, CW'.

http://www.remeeus.eu/hamradio/pa1hr/productreview.htm

You may send this link to other interested groups or persons.

I hope to read your comments or possible improvements.

Tnx and 73, Hans.

Topic: 6727 Message: 6727

Hello all,
I have a question for those of you with a 2S1 / 2000A combination.
I have a 756 ProIII and a K3 I would like to set up for a basic but occasional SO2R.
Is anyone currently using the 2S1 to feed 2 radios to the Acom2000A in an SO2R configuration?
I would be using N1MM+ for the contest software.

Please contact me with your comments on the 2S1 off-list at ab2e@...

From: ron@...
Topic: 6728 Message: 6728

I bought an Acom 600S and had a BCD Band Data Cat Connection Cable made up. Unfortunately I simply cannot determine the CAT/Aux Settings to use in order to enable communication between the 600S and the radio.

The CAT connection manual available on the Acom website provides two cable alternatives for the K3--a K3 RS232 CAT connection cable on Page 3 and a K3BCD Band Data CAT connection cable on Page 4. The "Help" screen in the Amp only appears to provide settings for RS232 users. I'd like to hear from anyone that can help, I'm stuck.

Date: 2015-08-04 02:24:11 UTC
From: Ron Freeman
Topic: 6728 Message: 6729

I discovered the following settings enable communication between 600S and K3 via the BCD Band Data Cat Connection Cable:

1. Interface = BCD

2. Command Set =5

3. Baud rate = 9600

4. Byte Spacing = 0

5. Polling Time = 500

The Amp is puts out 600 watts with 18 watts of drive. The manuals are either terrible or I’ve been spoiled by Elecraft, Alpha and other OEMs.

Hope this saves someone else some time.

Ira,
K3 has no handshaking. Just TXD,RXD.
In fact the only radio I know that has handshaking is the TS-480. There are undoubtedly others.

The BCD Band Data Cat Connetion allows the amp to pre-tune when the radio changes band i.e. the Amp follows the radio.

The cable is not a “need” but a “want” for an avaialble 600S feature..

6733. TR indicator

Yahoo group: acom-list (2010 — 2016)
Date: 2015-08-04 15:56:10 UTC
From: spikepost@...
Topic: 6733 Message: 6733

I seem to have a slightly weird problem on my Acom 1000.
If I use the TR tune indicator, it appears to be some 250 - 300w LESS output, than if you tune "for maximum smoke"
This seems to apply to all bands.
The amp is a 2002 model, which I have owned for some 5 years.
The amp was sent for a service recently, because I thought it had low power output, and always thought it had from buying it 2nd hand!
It appears that's never been the case, and it performs just as it should, (It came back with a report of 1000w plus on all bands) if you ignore the tuning indicator.
So, anyone else had this occur, and/or, is there any means of adjusting the TR arrow location in the display ??
Thanks all
Spike - G0CVL

I think it is best to contact Stan Lekov (or any other service representative) from Acom for detailed instructions on how to re-adjust the TR indicator if you intend to perform these tasks yourself Sir.

I was just wondering while the unit was under service this re-adjustemet was not taken into account, esspecially when you brought the Acom amp for service for this specific issue?

This is interesting.
The ACOM1000 is so quiet that one can't hear the T/R -- unlike many
other amps.
Usually that's good.

From: g3tkk
Topic: 6738 Message: 6738

Hello all

Just got my new 1010 amplifier and have an issue when using SSB.

Tuning up with CW mode goes ok. FTdx300 gives about 20 watts and I get 200 plus out of the amp with easy and clean tuning. No reflected power.

Keying the rig goes OK with just the green LEDs showing power out.

When I turn the mode over to say USB then talking into the mic sends the FWD green LEDs off the scale with even the red ones at the end of the row lighting up. No reflected power lights on but the G1 LED flickers too.

Using very low mic gain and processor settings makes no difference so is this how it works or is there a problem now??

Any thoughts would be appreciated

It sounds very much as though power on SSB from your radio is more than 20w watts. Check the level.

6741. ACOM 2000A - HV-reading fault, RCU display fault and shorted tube.

Yahoo group: acom-list (2010 — 2016)
Date: 2015-08-12 12:08:56 UTC
From: la7dfa@...
Topic: 6741 Message: 6741

My 16 year old ACOM 2000A recently got three different faults at once.
The display and leds of the RCU suddenly behaved totally crazy, scrolling and random lighing up.

At first I suspected the lov voltage supply. So I decided to replace the electrolytic capacitors on the low voltage board. I found C2 (grid) was leaking a bit, but else they seemed OK. Replaced the five big caps anyway. This did not make any difference, but I actually got an error message about low grid voltage, and later various low readings on the HV.

Then I cleaned and reseated the CPU in the RCU. This solved the RCU problem.

The voltage to the grid were OK at start, but during the startup sequence (after 100 seconds) it dropped to 40V (=shorted grid).
This indicated a faulty tube. I bought new tubes and installed them. Adjusted the grid currents. I also had to replace one of the four resistors in the HV metering circuit, it measured ~3MOhms instead of 1M.

After a few days the RCU acted up again. I reseated the CPU, and it now seems to work fine. I had to reset the RCU to get rid of a minor display error. The AC(OM 2000A) were black.

Elan,

I assume you are referring to the PTT current for the amp. I have just
measured:

PTT voltage 11.6V
PTT current 10.5mA

You can check it easily by just measuring the voltage at the unplugged
end of your PTT cable and then shorting it with the meter set to current.

I hope I've guessed your question correctly.

Regards,

Mike VP8NO

From: martins160@...
Topic: 6747 Message: 6747

Summer can be dusty in the shack....Do you have pets?
Pet dander clogs filters.

This is a reminder for those of you with amplifies that have filters
[aka 2000A series] to remove and clean the filter.

I have found by keeping the external filter clean the amp runs cooler, and
the insides keep clean.

Martin ka7gkn

6748. ACOM 2000A parameter adjustments

Yahoo group: acom-list (2010 — 2016)
Date: 2015-08-22 15:42:58 UTC
From: martins160@...
Topic: 6748 Message: 6748

My line voltage is 240VAC. when in the measure mode my RCU
displays line voltage at 245VAC. This is an instantaneous measurement!
My line voltage does fluctuate from 238-252VAC or 5% over time.

At what point should I go to the control board and adjust the voltmeter
reading to match the external reading [accuracy]?
I also see similar variances with some other parameters like exhaust air
temperature .....

Has anyone adjusted any other parameters?

My 2000A is about 14 plus years old and has the early control board.
I have almost 6000 hours on the original tubes. The amp runs perfectly
except for some parameter variances compared to external measurements.

I have done the EBS modification without incident!

Martin ka7gkn

6749. Re: [acom-list] ACOM 2000A parameter adjustments

Yahoo group: acom-list (2010 — 2016)

From: Rick ve3mm
Topic: 6748 Message: 6749

Hi Martin

If I remember correctly the 2000A ADC reads the voltage in 2 volt steps, so a 5 volt difference on the Mains Measurement is not out very much in my opinion. Maybe you could consider just leaving it alone for now.

I had a situation with my 2000A, where my line voltage was 240 V and the RCU was displaying it as 255V or so. All of the measurement parameters were out and the amp failed to start up. I did a repair which involved replacement of a trimmer pot RC2 in the op amp feeding the ADC.

You may want to go back in the list archives and seach for my post 6610 which has some info that may be useful for you.

Acom 2000a For Sale
I used this unit when I went to Yuma, AZ in the winter in my second ham shack.

Later I started using Remoterig and the Acom 2000a that was at my home location.
As a result, this unit has been idle for about 4 years, sitting in my closet.
I kept it as a backup, which has never been needed. The RCU is the original model.
I only had 110V in Yuma, so it has never really been exercised at 220 volts.
It has the external fan. This must be the most under utilized unit to ever be
put on the used market. It is currently in Hattiesburg, MS. You can pick it up
there, or pay shipping. Or, I can transport it to Yuma, AZ by Oct 23.

Serial 050188 Price is $5800. 817-821-3770 and leave a message. 73 Ken K5WK

6751. Carrier level

Hello All,
I have an Acom 1000 and I drive it with a Flex 3000 and like to run AM.
What would be a safe AM carrier level for this amp?
I am currently running it at 150 watts of carrier.
Any input would be appreciated.
Thanks,
Don W9BHI

Topic: 6751 Message: 6752

Hi Don,

It depends upon the amount of CW output you can get without over
driving. The tube in the ACOM1000 can go flat with time.

If that is 1000 watts, then 250 W carrier power would be OK (4:1).

However if you can only get 800 W CW out of it on the band of interest
then 200 W of carrier would be the max.

Of course 150 W is OK.

Monitor tube exhaust air temp for the first couple of operations.

6753. PN07 fault

Yahoo group: acom-list (2010 — 2016)
Date: 2015-08-31 08:33:47 UTC
From: GL-DJ3IW-Web
Topic: 6753 Message: 6753

I am writing on behalf of a fellow amateur, Bernd. DC3HB. His ACOM1000 has quit working. He was using it in a recent RTTY contest under high (30+ C) room temperatures and at the end of heavy RTTY transmitting shut it down without letting it cool down.

Since then the amplifier refuses to work. When the switch on the back it closed to ON, the display briefly lights and then displays a flashing PN07. In addition the red/green light of the front on/off switch does NOT illuminate.
Pressing the OPER button displays 1APN07 000000 010100. We know that this means an "hvm" error.

Can someone give us an information what fault/defect could result in this error indication and the amp not working?

I hope this is not the case with your friend but in my case was the result if a failed transformer where the HV windings had developed a short. It is possible to check this and eliminate it as a problem by a simple resistance check.

I will round up my archived emails on this and forward to you in due course.

The transformer is quite complicated and expensive.

I do hope you can eliminate this as a problem.

Ken, please let me know what you find if it is off list. I also need a couple of those critters.

I needed some of the black cabinet screws for my 1000 and found them on Ebay.
They came from China and the heads were a little bit smaller but
worked fine.
I have about 200 of them left. If antbody needs some, let me know.

take the screws to Lowes or HD.
match the correct size, ie- #8 fine, and get them on ebay. I did that for a
radio.

what is the correct procedure for the acom2000 to make this? Can you please explain the steps? do you need to open the whole cabinet or it is enough to operate externally only? Thanks

You should see in the rear of the ACOM 2000A a thin foam filter.
This is located where the optional fan would be installed. If you do have the external fan be sure you have the foam filter mounted at the exterior of that
fan as it blows air into the amplifier.

This filter keeps most dust from entering the inside of the amplifier.
Simply carefully remove this filter and rinse it out, let it dry, and
carefully replace it. If you keep the filter clean you should not
need to open the amplifier except for every few years to blow
out any accumulated interior dust.

I have a 1999 vintage 2000A so I'm not familiar with the newer
versions. I suspect they still have the foam dust filter.

Regarding the other ACOM amplifiers I do not know if they have exterior foam filters.

I used isopropanol to clean the contacts on the RCU CPU.

However later I found (tip from ACOM) it was the (P)ROM in the RCU thad did create the problem for me.
After I reseated the PROM, everything has been superstable :)

ok, i succesfully did the job, thank you for your suggestions;

i confirm you that on the new 2k versions the fan is mounted outside, it is not necessary to remove the cabinet, you just need to remove the square plastic mask to access the foam: in my case it was completely gone, apart that it was completely dirty it also completely crumbled between my fingers and it was no longer usable..

I replaced it with a mosquito net, the same one that i use on the windows of my house, that has the same diameter holes of the old foam; I hope i did the right thing.

I have too an acom 1k with the Optional External Fan mounted by a UK dealer, but in this case there isn't any plastic mask to remove, I think that to clean up the fan it is unfortunately needed to remove the whole cabinet and maybe to disassemble all the fan, and I do not want to do this. Anyone here with my same situation?

Good Morning,
This is Mark Griffin, KB3Z and I am looking to connect my old TS-940S to my Acom 1000. I have looked at cables that are being sold out on ebay and they have the DIN plug that goes into the back of the 940. They also have 2 phono plugs, one labled RLY and the other is ALC. I would assume that the RLY connector is the one that would be connected to the Key In connection on the 1000. Or, am I incorrect in that assumption? Thanks for any help/suggestion on this question. I fitted the external fan on my A1000. I didn't have a snap on filter holder so I first fitted the fan with an internal finger guard with short screws. Then I reinstalled the metal mesh filter to the outside of the fan, also with short screws. That way it can be easily removed if necessary. Personally I think not having captive chassis nuts for the fan/filter fixing is a big mistake. Unless things are different for current models, removing the filter from a basic A1000 requires removing the covers and the main transformer, the latter is not a nice job.

Hi Mark,

If I dust off the cobwebs I remember something about the DIN connectors on the Kenwood rigs that there were two different sizes for the same number of pins. I remember having some DIN's that did not plug into the Kenwood. Just saying this in case you rig into a situation where the DIN does not plug in properly.

Yes, the RLY connector is correct.

I have a TS930S and the Transverter socket used a strange 8 pin DIN that standard DIN's would not fit properly.

The Remote connector which drives the Amp uses a 7 pin DIN which is pretty standard. The Ebay cable should work OK and yes the amp relay connects to the RLY phono.

Look here at Page 29

http://www.kenwoodusa.com/UserFiles/File/UnitedStates/Communications/AMA/Manuals/TS-940.pdf

I had hot switching issues when I drove an Acom 1000 from my TS930S. It was the fault of the 930 but the Acom would fault off due to RF present when the Acom vacuum relay was commanded to switch.. I fixed the problem with a DX Engineering sequencer.

Mark,
So if I am reading your email correctly the 940 may have some timing issues if I choose to run Full Break In CW with the 940 while connected to the Acom 1000. Perhaps one would be better to run Semi Break in to avoid the timing issues between the radio and amp versus full Break in. Am I correct in my assumption?

If I remember correctly, and this was a long time ago, for my TS-930, 940 and 950 when driving my Alpha I had a timing issue using the internal Kenwood relay. I had to use the transistor switch output from the Din plug on the Kenwood to drive a power Mosfet which keyed the amp. Simple circuit - one Mosfet and two resistors. This might work also with the Acom. The Kenwood small relay was too slow if I remember correctly.

Tony is absolutely right. I've already commented to Mark offline that trying to drive the Acom or an Alpha (or virtually all available amplifiers) from the internal relay of his transceiver is a recipe for failure.

I'm traveling and don't have access to my TS-940 Service Manual, but I believe an inverted version of the +12 transmit logic signal on Pin 2 of the TS-940 XVERTER DIN connector is the proper to signal to use. The equivalent signal in the TS-950SDX is "TXB", and it provides adequate "advance warning" to either the Alpha or Acom QSK systems to do the job. Alpha recommended, and I have successfully used, a simple 2N2222 NPN grounded-emitter inverter stage to key both an Alpha 87A and an Acom 2000A properly from a TS-950SDX and a TS-480. I even built the inverter stage into my Heath SB-220.

So Mark is correct that he should operate only in SEMI QSK mode if he chooses to key his Acom with the relay inside the TS-940 instead of with an electronic logic signal that "anticipates" the appearance of RF energy at the Kenwood's coaxial output connector by an adequate amount (a few milliseconds).

Hey Guys,

Even though the specifications do not elaborate on QSK and keying speeds (Why not?), there is a credible product review available.

In the August 2015, QST Magazine, there is a product review for the ACOM 600S. Regarding keying transition time page 48 says,

. "Unkey to key, 12 ms: key to unkey, 23 ms."

Sorry, I did a quick scan but have not yet read the article in detail. That said, I did not see a reference to keying speeds and QSK. <More ??'s>

Seems like it would be a good time to get out the manual (or product review) for your particular transceiver to check what adjustments or allowances to make. Some of our computer interfaces also allow adjustments to be made or to provide sequencing to avoid hot-keying as well.

It looks like another excellent piece of gear from ACOM. I am enjoying my ACOM 1000.

For what it is worth the K3 has a 9 ms key to RF out time. While there is a TX delay control, at least the older K3's CW became QSD with an increased value. This issue may have been resolved in the K3S. Perhaps someone else knows.

So hot switching is a possibility with this and the K3 without some sequencing.

Thank you guys for your comments. I am thinking about a Acom A600S to replace my Ten-Tec Centurion which is about 18 years old.
The rig that I am using is a FLEX 6300. It has very fast break-in and doesn't overshoot like my PRO3 did.

I mostly operate RTTY so break-in is not as important but I do a lot of CW contests.

From: dxbuster
Topic: 6780 Message: 6786

Guys,

12ms to key and 23ms to unkey is far from full bk-in / QSK.
The numbers seems to be correct, as there is neither PIN diodes, nor vacuum relay in my ACOM 600S. The relay I see there is same as the one in my ACOM 1010.
Nevertheless ACOM 600S does nice semi QSK CW with K3.

6789. ACOM Director 0.8.0 Now Available

Yahoo group: acom-list (2010 — 2016)
Date: 2015-09-20 19:58:15 UTC
From: James Thresher
Topic: 6789 Message: 6789

I'm pleased to announce that ACOM Director 0.8.0 is now available. Following on from the introduction of Logger32 support for frequency tracking in version 0.7.1, this version now contains support for DXLog integration to allow the ACOM 2000A to track the frequency of your radio for users of DXLog.

Version 0.8.0 also contains many changes behind the scenes in preparation for support of other hardware in the future (hopefully the ACOM600S when I eventually get hold of one)

Please note that this version is largely untested as I no longer have access to a real ACOM2000A anymore and rely on a "virtual" software emulated ACOM2000A for testing.

You can download it at www.m0yom.co.uk/download/
<http://www.m0yom.co.uk/download/>

If anyone has bug reports or feedback, you can email me at james@...

6797. Re: [acom-list] External fan Acom-1000

Yahoo group: acom-list (2010 — 2016)
Date: 2015-09-22 17:30:49 UTC
From: Mike Harris
Topic: 6796 Message: 6797

I have fitted the external fan. Not speced or supplied by Acom.

Sunon DC AXIAL FLOW FAN, 92X92X25MM, 24V
Bearing Type: Precision Ball
External Depth: 25mm
Fan Frame Size: 92mm
Flow Rate - Imperial: 45cu.ft/min
Flow Rate - Metric: 76m³/h
Noise Rating: 34dBA
Power Connection Type: Wire Leaded
Series: KDE
Supply Voltage: 24VDC
Current Rating: 60mA
Current Type: DC
External Height: 92mm
External Width: 92mm
Frame Dimensions: 92mm x 92mm x 25mm
Operating Temperature Max: 70°C
Operating Temperature Min: -10°C
Power Consumption: 2.2W
Speed Range Max: 2600rpm

Works fine and when I'm running an RTTY pile-up the chimney temp hovers around 56C with 600-700W indicated output. 45cu.ft/min is greater than the full power airflow requirement of the GU74B (4CX800A):

Cooling air temp 25C

800W plate dissipation - 20 CFM sea level and 25 CFM at 5000 feet.

Cooling air temp 50C

800W plate dissipation - 29 CFM sea level and 35 CFM at 5000 feet.

At 45 CFM for the fan I do not believe it is starving the blower which being down stream is reducing, or even eliminating, any potential back pressure which fans do not like working against. I have reused the original metal mesh filter on the outside of the fan, not having a clip on foam version.

The 24V fan supply in the 1000 is not regulated and there is an audible fan speed change when going from RX to TX. However, I have no idea what the actual voltage is when on RX or TX.

Regards,

Mike VP8NO

On the GMDX - Home http://www.gmdx.org.uk website, there is information on the Acom 1000 from Mike, VP8NO, showing a fault code signature spreadsheet, tube replacement instructions, protection parameters, and vacuum relay replacement instructions, among other info. Is there similar information available for the 1500? It would be nice if Acom included such info in their manual. I know they have to CYA on possible liability with deadly HV issues, but at least the spreadsheet and protection parameters (showing normal operating values and fault thresholds) would be helpful. Thanks for any help.

I have to agree with this request, except include the Acom 1010 in the advanced documentation (please). While I certainly understand the manufacturer's need to CYA (mitigate risk) for potential liability issues and account for the occasional complete idiot who spills hot coffee on themselves, I would happily sign a liability release.

For those among us "qualified" (I'm a retired electrician who holds a GROL & previously maintained an RF- Harris FM20H5) what harm is there in allowing us to have this information?

Heathkit was back in the days before our society became so litigious, back before people could get awarded millions of dollars for accidentally spilling hot coffee in their own lap & then suing the restaurant.for their own stupidity and the liberal court system siding with the plaintiff. 30 years ago your case would be thrown out and you'd have been told to be more careful. Nowadays you're awarded damages and companies have had to hire entire Risk Management departments and establish all sorts of absurd rules for purchasing and using their products. Be thankful that the case isn't riveted on.

6806. Acom 2000 not taking drive

I key the exciter, I see its output on the forward power indicator of the Acom. But its only at the level of the exciter.

I press tune, and it shows 500 watts output.

If it were a bad key line connection, I would not see the output for the tune. Any ideas? It seems to be solid failure now.

6807. Acom 2000 No Amplification

Yahoo group: acom-list (2010 — 2016)
Date: 2015-10-11 22:28:23 UTC
From: kenw817821@...
Topic: 6807 Message: 6807

I love it when I convince myself I have a problem, and I do not.
An unnamed person (me) had turned the output on my K3 to less than 5 watts a couple of weeks ago on 2 bands.

What I saw on the forward power of the Acom was 2 watts amplified into about 35-40 watts - the usual driver level I use to run the Acom 2000. You are never too old to make mistakes!

Its almost like April Fool.

Friends,

I just had a failure on my A2000, which is critically needed for the WAG contest this weekend.

The mains fuses blew, and when replaced, after the heating cycle the amp reads BIAS TOO LOW AT POWER ON: -000V.

Does this refer to tetrode screen grid bias or? Can anyone note a likely failure? Time will be tight for repair...

How is the amp interfaced, and with what transceiver? What does "press tune" mean? Is this a control on the transceiver, and if so what one?

Can you confirm the drive power level to the exciter? Are you certain that it is the same as amp forward output shown?

Thanks Barry, I have found messages both about C3 and a failing tube going shorted G1 to cathode. C3 seems unlikely to me since it says 0.0 V. ...and I have confirmed that this is control grid bias, of course.

I'll call Array Solutions today and see if they recommend a tube swap. I've had this set 12+ years, so I have no complaints!

I had similar troubles. I sent my unit back to ARRAY SOLUTIONS.

They put in a "matched pair" of tubes and replaced the caps in the bias supply, did all the necessary tweaks.

Amp now better than new. I could have done it myself (retired engineer) but let them do it.

Array solutions .... still the place.

I bought a spare set, tested them, and put them on the shelf. I figure having a spare set will ensure the originals don't go bad :-)

I will swap in the spares after a year and run them for a while.

It's important to remember to set the bias when swapping out tubes.

Agreed Larry,

Jay and the gang are great and I usually have them do all my work. This time I am in a time pinch and will try to cover it. Jay was very responsive as always, and gave me some great tips and preventative items while I am in there. (My amp is 14 years old.)

I agree with both of you. I did buy a spare set some time ago (at a "bargain") and found that one of the two was slightly damaged physically. I don't know if this will be an issue or not. But I'd as soon keep those for spares and get a nice new tested set from Jay at Array. I also have an A1000 so the commonality is nice!

Friends,

I have completed my A2000 repair. I did in fact have one tube with a cathode to control grid short. After 14 years, no gripes there! Jay expedited a set overnight and I am in business for the weekend. RF output also increased about 15%. (PS - be careful with those temp sensors when changing tubes!)

On his advice, I also changed all the aging electrolytics on the LV board, so I look forward to 14 more years of heavy use! :-)

14 years, that is pretty darned good. Array Solutions is another good place. I keep hearing of occasional failures with the Acom 2000, then I see where it's after a dozen or more years. Seems like a pretty good and reliable amp. No blower problems or noisy relay either. Everybody seems to like their 2000A's.

Having had three 9500 amps previously, I can say the 2000 is the best amp I've owned.

I even had an OM2500a but couldn't deal with the noise of the blower. The 2000 is very tolerable in the shack, and the color remote display looks nice on the desk. ☐

6825. K3 to Acom 600s cable

Yahoo group: acom-list (2010 — 2016)
Date: 2015-10-18 12:20:18 UTC
From: n1nk@...
Topic: 6825 Message: 6825

I recently purchased an Acom 600s and then purchased the Array Solutions interface cable for my K3. I was expecting the cable to have DB15HD connectors and pass K3 Band Data (4 bit like Yaesu) to the 600s coming from the K3 ACC port.

Rather, it has a DB9 at one end. I assume this is the serial CAT interface but do not want to hook it to the K3 serial port without knowing what is what.

Also, there is already a use for the K3 serial port, namely the P3 and the microHAM hardware which sucks up the CAT information. If the 600s is only listening then it will likely not interfere but if it also transmits then problems await me as a serial port can have only one transmitter and one listener except that a passive listener can exist. SteppIR does this.

Has anyone been down this road before?

Jim/N1NK

Have you looked at page 9 of the manual?
http://www.manualslib.com/manual/731154/Acom-600s.html?page=9#manual

There is no telling what interface cable you have without buzzing it out with an ohmmeter. Sounds like it may be ACOM > serial RS232.
However you have to be careful . Among other things the ACOM 600 HD connector has both RS232 and TTL level serial interfaces plus BCD band data. You would probably need RS232 level. It is rumored that the K3 might also work with TTL levels-- many computers do but the signal polarity has to be flipped.

Personally I prefer using BCD band data-- especially if you have a P3. It would avoid the additional Y cable mess and complexity.
The K3 BCD band data appears on the K3 15 pin HD din connector.

If you want BCD data then check with ARRAY Solutions to see if they have such a cable.

73 de Brian/K3KO
p.s. I haven't got an ACOM-600 so the above is pure "theory".

6827. ACOM 2000A tube temp question

Yahoo group: acom-list (2010 — 2016)
Date: 2015-10-18 13:10:09 UTC
From: Bruce Meier
Topic: 6827 Message: 6827

I have a question about ACOM 2000A temperatures for the rear and front tubes as displayed in the remote. I have (2) Acom 2000As and they are both acting the same, specifically - the front tube runs at a higher temp than the rear. If it was a couple degrees I would not think it an issue, but in both cases the delta could be as much as 10 deg C. Also, the temp readings are MUCH higher than what others have observed based on reflector postings. During the Stu Perry the temps got as high as 71 rear and 81 front and I was not pushing them. I was calling CQ at 25 wpm with a 3.5 second break between CQs with a run rate averaged from 60 - 80 Qs per hour. The filters are clean (even ran without filters for a while without any difference), the inside of the amps are spotless (they both had a recent cleaning and they are covered when not in use) and the blowers sound fine (no bearing noise). The shack temp was about 70 deg F at this time.

As a high water mark, I loaned my station out for WAE-SSB and at one time the temp readings were 90+ Rear and 100+ Front. The shack temp was about 80 deg F at this time. Both amps were running as the Op was running SO2R so they were busy. Yes, that is not close to the max temp allowed, but when compared to other postings my amps run about 30+ degrees warmer.

Comments? Suggestions?

73,

Bruce - N1LN

FWIW, Stan at Acom once told me that a 10 deg C difference was still within the limits of an acceptable match for the tube pair, although it shouldn't be greater than 10 deg C.

My take is that 71C/81C is not that high and nothing to worry about.

That being said, I'd always have a spare pair of tubes on hand.

6829. Re: [acom-list] K3 to Acom 600s cable

Yahoo group: acom-list (2010 — 2016)
Date: 2015-10-18 20:23:05 UTC
From: n1nk@...
Topic: 6825 Message: 6829

Brian is spot on with his analysis despite not owning the relevant hardware. The Acom 600s document set contains descriptions of interface cables for a number of transceivers. For the K3, both a serial interface using a DB9 format connector at the K3 end and a Yaesu type band data interface using a DB15HD connector at the K3 are described.

I had expected the band data interface cable from Array Solutions but got the serial interface cable. The band data interface cable can be paralled onto other cables without causing mutual interference. The serial interface cable can be paralled only if the Acom 600s is a "listener" as this does not cause interference.

I will be in touch with Array Solutions on Monday.

Barry,

Arguably correct, but the disparity in tube operating temperatures would be an indication to me that they are not that well matched of a pair. If they are original factory tubes that have been in service for a while and this is a new issue, then perhaps they're not aging-down at the same rate or else a problem in the bias circuit. What you're witnessing is one tube working harder than the other. Perhaps within spec, though marginally so, which would be a vexation to me in such an expensive product. If anything, at least ask around to see what other 2000A owners are experiencing. (personally I can't afford one)

IMO the issue is more likely than not to worsen with age. If you're seeing this anomaly in a pair of fresh tubes that you just purchased from a vendor who promised you a matched pair, I would not hesitate in returning them. Only my 2¢ worth.

Hi Bruce,

you may want to consider swapping the devices over to see if the temperature difference is genuine or just a sensor calibration issue.

In addition to Bill's comment it maybe bad airflow design if the same socket on each of your amps runs higher than the other.

So swap the valves between front and back sockets and see if the high temp follows the valve or stays with the socket/sensor

While doing that check the valve fins for blockages or dust. I wash mine under a running tap flowing the water in the opposite direction to the airflow then dry thoroughly

Bruce

As stated by some members you can calibrated the temp. sensors using a VOM meter with a temp sensor.

If the difference in temp is confirmed then you can have non matched tubes.
It is possible that one tube has gone away from the specifiactions by age.
Maybe that tube needs another bias setting , you can read the tubes replacements instructions for this. I believe in the 2000a there is a automatic procedure to follow.

Normally matched tubes are within 10 % of its other electrical specs, therefore the 10 C difference thumb rule.
Good matched tubes have a temp. diff of about 2 a 5C.
If the cooling fins or socket are not blocked by dust there is no reason for a great temp. diff other than unmathed tubes. The airflow trough the front or back tube is about the same.

Airflow can be checked by cutting a 4 inch long by 0,5 inch wide paper in small 4 stripes, leave 1 inch uncut. That end can be sticked next to the ventilation holes and observe how high the paper is moving in the air flow.
You can cut two the same papers when cutting them togehter one paper on another. A difference in air flow will be seen as how these stripes are moving into the flow.

You can leave one or the pair of papers on during use or in an contest, it is an visible control of the airflow.
When the fan is blocking or not working normally it will be seen. This simply method has been used on several cooling fans of automated machinery.

Excellent advice and simple indicator of airflow out the tube. It just works. Thanks

As stated by some members you can calibrated the temp. sensors using a VOM meter with a temp sensor.

If the difference in temp is confirmed then you can have non matched tubes.
It is possible that one tube has gone away from the specifiactions by age.
Maybe that tube needs another bias setting , you can read the tubes replacements instructions for this. I believe in the 2000a there is a automatic procedure to follow.

Normally matched tubes are within 10 % of its other electrical specs, therefore the 10 C difference thumb rule.
Good matched tubes have a temp. diff of about 2 a 5C.
If the cooling fins or socket are not blocked by dust there is no reason for a great temp. diff other than unmathed tubes. The airflow trough the front or back tube is about the same.

From: n1nk@...
Topic: 6825 Message: 6836

Array Solutions will be sending me the cable I asked for in the first place. The one that they sent works perfectly fine so long as the K3 serial port is not being used by any other device. I am not sure if the amp will co-exist with a P3 but it sure will not co-exist with the microHAM devices.

All will be FB in the N1NK shack in a few days. In the meantime, I just need to remember to change bands on the amp or transmit following a band change on the K3 and let it sense the new band and change. I prefer to let it change automatically prior to application of RF.

6837. Muffin fan for Acom 1000/1500

Yahoo group: acom-list (2010 — 2016)
Date: 2015-10-21 00:52:14 UTC
From: radiok7jq@...
Topic: 6837 Message: 6837

Rather than installing the auxiliary fan accessory on the rear panel air intake, has anyone tried (or is it feasible) using an external muffin fan (like a 12V, externally powered, switchable on/off when/if needed) placed over the tube air exhaust on top of the cabinet (sucking air out more rapidly)? Mounting could be done using small magnets stuck on at each corner of the fan so you won't mar the cabinet. My previous THP amp had an accessory external fan mounted over the exhaust that really kept down the radiated heat from the finals, even if the internal fan kicked into high speed (which was rare). Although the specs say it's not needed unless used for continuous duty like RTTY, it still gets really hot, and extra heat removal should be beneficial under any conditions. Any thoughts?

Unencumbered by any actual knowledge... The fan on the exhaust side is:

1) Gonna (hill-billy for "Going to") be a hot air restriction when it's off.

2) Unless it's a pretty strong (high cfm) it's gonna be a restriction
when it's on.

3) If it has 'nuff cfm then it's gonna be noisy.

4) Almost always better off pushing in cold than trying to extract hot.

Thanks to everyone for the suggestions. This is what I have done so far.

1. Took the amp apart and cleaned the blower. There was some dust on the vanes, but gone now.
2. Cleaned the filter - was not dirty as I regularly clean it, but did it anyway.
3. Adjusted the bias. The readings were a bit off, but are now in the middle of the acceptable ranges.
4. Changed the line voltage setting to NORMAL. My line voltage is 245 which is in the NORMAL range.
5. Retuned the amp using 'auto tune' as I use the amp from band to band.
6. Cut the paper as suggested to test air flow.
7. Brought home a Fluke IR thermometer to compare the amp reported temps to the IR temp tester.

Results: While using the amp last night, although light duty, the reported temps were lower (as expected due to light duty - so not a real test), and the front tube was still showing a higher temp.

Used the IR temp tester - the results was that the tubes were within 1 - 2 degrees.

Next Steps:

1. Adjust / calibrate the sensors: Where can I find the sensor calibration procedure? I checked the docs that I have and it is not there.
2. I will also be swapping the tubes (front < > back) but not yet.

I will continue to report the results and really appreciate the assistance.

AN old adage: DO what the manufacturer says.

I've done two of the recommended external fan mods. It is reasonably cheap, relatively easy, and when finished it's out of sight, quiet, reliable - electrically and mechanically and fully integrated in the sense that it is meant to work with the amp and provision is made on the main board to facilitate its electrical connection.

Bruce,

Thanks feedback. Careful on swapping tubes. It is easy to break the leads of the transistor looking temperature sensors in the rubber chimney.

Also you might verify that HV readout is reasonably correct. A simple efficiency calc of output power/(plate V*amp) power can help detect. The older ACOM I had over 12 years ago showed an efficiency of 85%! It should be about 60-65 % key down.

The ACOM HV divider resistors have a habit of going high and the HV then reads low. Not a concern unless one worries about amp going non-linear. After they go high in value, then fail at some unpredictable time in the future. ACOM supplied new ones. Unfortunately they are buried in the PC board stack.

While you're at it inspect the molex connectors for the filaments. Earlier units had a problem with them getting oxidized and eventually failing.

The other school of thought says that since your tubes are within 1-2 degrees of each other and the amp is operating fine, just use/enjoy it and don't mess with it and possibly break something. Unless, of course, you're one of those rare individuals who doesn't tend to break things ;-)

Good luck whatever you decide.

6844. Acom 1010 failure

Yahoo group: acom-list (2010 — 2016)
Date: 2015-10-25 20:30:08 UTC
From: g3tkk
Topic: 6844 Message: 6844

Just had a sudden failure to my nearly new Acom 1010.

It was working fine and I went to have a meal and left the rig on as well as the amp though I switched the OPER switch to off.

On my return the amp is dead, no fan no lights on at all. Checked the plug fuse and the two on the rear of the Amp but all Ok.

On switching on I can hear faint sounds as though a transformer has power but there are no leds or fan alive.

Any ideas? Can I safely go inside to check the two internal fuses?

Peter

When the power off, wait at least 5 min. to go inside, then the capacitors are discharged. Better is to pull out the mains.

According to an Acom executive, the 1500 is not being discontinued, and will still be manufactured as long as there is demand and orders for them. The 2100 will just run legal limit continuous on all modes, be physically larger, and more expensive.

Hi Peter,

Armed with little information other than your symptoms, my guess would be that you have blown one of the internal fuses, either in the high B+ or the filament supply.

If it's brand new, contact whoever you bought it from and return it.

Either way, I would suspect that replacing a blown fuse in either section of the power supply would most likely result in another blown fuse, (Very important that you use the exact same value fuses, which unfortunately aren't readily available (at least not in the states) except from the big supply houses like Mouser or a FRY's Electronics store).

HV (B+) Fuse = Littlefuse #0218002 2A **slow** blow
Filament Fuse= Littlefuse #0218005 5A **slow** blow

A blown fuse in the power supply does not happen at random. Rather such occurrence would be indicative of a shorted tube or a failed rectifier diode(s). There is an unofficial document in the files section here that can guide you in tube replacement. The first thing I would probably do would be to yank the tube, then replace the HV (or filament) fuse.then fire it up again. If the HV fuse blows a second time with the tube pulled then likely one of the diode rectifiers has failed. If the filament fuse blows a second time (with tube pulled) then look for a defective fan,

These are nothing more than wild guesses, but maybe a place to start, assuming you want to try to fix it yourself.

There are other internal fuses too but those are in the soft-start circuitry and it would be practically unheard-of for one of those to ever fail.

My money is still bet on a defective tube.

6850. Acom 1500 filament wiring failure

Yahoo group: acom-list (2010 — 2016)
Date: 2015-11-07 20:08:55 UTC
From: john@...
Topic: 6850 Message: 6850

My Acom 1500 was purchased new from Array Solutions in December, 2013. I used it for SSB only, and have not operated in contests. The Acom 1500 had given me excellent service, but a few months ago I noticed the RF gain was starting to gradually decrease over a period of weeks. The screen current at 800 watts output was -1 ma. This seemed to me to mean the 4CX1000A was going soft.

I called Array Solutions and described the problem to them, and they reacted with surprise since no one else has had problems with this amplifier. I continued to operate, and about a week later the amplifier stopped functioning entirely. The amplifier was still within warranty, so I shipped it back to Array Solutions. In a few days they gave me a phone call and told me that a plug in the filament circuit (6 volts at 9 amps) was faulty, and some of the filament wire insulation near the plug had melted because of the poor connection. Array Solutions replaced the plug and filament wiring, and the amplifier was then in working shape.

The repaired 1500 was shipped back to me, and it seems to work like it did when it was new. I want to draw attention to the prompt and excellent service I have received from Array Solutions. I will continue to buy products from them.

6851. Issue on Acom 1000 6M No Output

Yahoo group: acom-list (2010 — 2016)
Date: 2015-11-08 22:41:53 UTC
From: John A. Ross [GM1BSG]
Topic: 6851 Message: 6851

Hello

I have an Acom 1K on loan to the local club here which basically sits only on 6M. The club already has 3 other Acoms of their own so most folks are familiar with them

I had not been for a few weeks and today I was informed it had apparently stopped "keying" on 6M for no apparent reason.

After checking all leads and cables (it is driven from a IC-7600 and I have same setup here at home) they eventually swapped the Acom around from one installed on the 80/160M station.

Now the Acom not working on 6M seems to be working perfectly on all HF bands.

The Acom removed from HF and put on 6M works fine on 6M

I do not have hands on it yet, but any known issues like this ? Any random button presses that can lockout 6M that I do not know about ?

No error codes seem to be present

The original comment about not keying is obviously inaccurate

Any pointers appreciated as at the moment I cannot find anything wrong and see no logical reason it would not perform on 6M as if there was a fault I would expect to see a trip of fault condition, not just staring back smiling.

John

Hi John,

When you key the Acom with the band switch on 50, do you see the idle current? (between 60 - 70 mA with no input) With tune on position max and the loading, is the TRI showing anything? Is the Anode current changing during load/tune?
\when you only see the idle current, and nothing changes when you load/tune, seems a problem with the band switch to me: broken contact.

However your post is unclear: You said "the Acom removed from HF and put on 6M works fine on 6M" So it working on 6 or not ??

Hi Ger

I have not had time to check it myself.

There are 4 stations in the shack with Acom 1K, HF1,2,3 and 6M, 4 in total, my Acom is on 6M and “stopped” working.

Swapping Acoms from 6M station with the one on HF3, mine works fine on HF, the one removed from HF3 and installed at the 6M station, is also working fine.

The issue followed the Acom, sorry if that was not clear.

John

Subject: [acom-list] Re: Issue on Acom 1000 6M No Output

Hi John,

When you key the Acom with the band switch on 50, do you see the idle current? (between 60 - 70 mA with no input) With tune on position max and the loading, is the TRI showing anything? Is the Anode current changing during load/tune?

\when you only see the idle current, and nothing changes when you load/tune, seems a problem with the band switch to me: broken contact.

However your post is unclear: You said "the Acom removed from HF and put on 6M works fine on 6M" So it working on 6 or not ??

Friends,

I find that these screws are soft and easily mangled every time I service the amp. How about you? I finally found a source, but I had to order 1000. They were cheap. If anyone else is in need of them, send me an SASE and I'll send you some.

73,
Drew K3PA

Drew
The screws are not that soft, but the metal sheet will damage the tread when the screw/cover is not
corretly placed. Or when thigting the cover will deform and cutting in the srews.

Therefore when demounting the topplate : loose the screws situated diagonally by one by one for abt two turns, While doing this you can push the plate a little side ways. Then again one by one two turns and then you can furhter turn the screws by hand and take them out. If you have to turn them out with a tool it is not normal, the cover is friction against the tread.

For mounting the plate : same way , turn the screws in diagonally for two turns by hand, It must go easy if there is a restistance when turing then the plate is cutting in the tread. Push the plate a little , it will take another positon. Then use a srew driver to turn the srews almost to the end, this must be done again srew by screw at the front/head/middle/side ...
The starting positing on the top cover over the chassis is important.

Hope this helps reducing damage to the srews.

John
I would start to open the little cover under the amp , there is the input circuit.
Check for loose wires.
I have no schema anymore of the 1000, but I think they use a realy to switch in coil on 10m, maybe also
on 6m.
Works this amp still on 10 m ?

I had the guys swap back the amps today and so far all is working as it should, no issues.

So far the possibilities are small, including user error.

But, its working

Are these the brown cover screws with the fixed washer or something else? I have one of the cover screws that is bad. When I received my A1000 I removed all the covers to check for damage and to make sure everything was still in place after shipping before applying power. One of the screws was seriously tight and the cross head was slightly damaged in the attempt to remove it. One of the problems is the variation in cross head screw pattern and the danger of using a non-matching screwdriver or one that has simply seen its best days.

If they are the matching cover screws, well I have some unused GS to exchange for a few.

Hi Mike,

Mine are black, but yes, there are the tiny ones with the built in washer. If black works for you, I will be more than glad to send you some. No GS needed - they were cheap in quantity. Use your callbook address? About how many do you need - perhaps a whole set so they match?

Hi Roger

I got mine from Vine Antenna in the UK. It took a few days for them to get tubes from their supplier and test & match a pair. Total was right around $600 shipped for matched pair and less than two weeks from order to delivery stateside.

Well I just purchased the 1010...being delivered today. It uses the same tube so I am also very concerned. I did find a supplier on line that has six in stock at $160.00. I sent an email to Acom asking about the availability of the tube and why they chose to use this tube if in fact it is no longer available. I may consider buying one of the six and just store it in case I ever do need a replacement down the road.

Also a lot of them available on Ebay. I actually came across posts as far back as 2007 about these being discontinued then, and a letter from Acom stating that it was strictly a rumor and that the tubes are readily available. That was 2007, but good to see that they are still available. Jim K2QB

Just FYI,

I replaced two of those tubes in my A2000 last month after 14 years of heavy contest service, as one had become intermittent. They were still outputting about 85% of the power they produced when new.

The Russian designation for the tubes used by Acom and others is GU74b. This may help your search. I purchased my replacements from Array Solutions, because they were fully tested and shipped overnight. As well as AS's general awesomeness.

The amp arrived yesterday and much to my surprise, it looks ten times better then any of the pics I have seen to date. The front has been revamped with all the LED's being recessed behind the front panel and not visible unless lit. This thing look more like a piece of high end stereo equipment then a linear. I uploaded a pic if you care to take a look at it. As far as the operation, having only played with it for one evening I can say I am excited to out it through it's paces. Tuning it up on the bands was a breeze and 30w to 40w in got me 700 out with no problem. Took me only one night to realize I made the right decison.

Date: 2015-11-20 17:21:42 UTC
From: Doug Smith
Topic: 6884 Message: 6885

I find the settings on the ACOM 1500 very repeatable. They would be more so if they had used a vernier control and had 100 hash marks instead of 20. (And, that is my only minor criticism of the amp which I otherwise love.)

I think the loading control is generally more sensitive to position and, while touching up the tuning, I find it needs adjusting more often than the tuning control. But, then, I like to have that thing perfectly adjusted. The tuning control is nearly always right on the money.

I always do a “touch up” tuning. Usually takes two short bursts (less than a second) , one for each control.

I find them repeatable to a degree, provided you're in the same general portion of the band you're changing to when you last used that band. Also depends on how SWR broadbanded your antenna is. Personally, I ALWAYS check SWR first (you never know if something external affected it), then fine tune after each band change...only takes a few seconds. The load control is more "touchy" than the Tune control. Better to be safe than sorry.

There are some resources on the web, one is here
http://www.mods.dk/manual.php?brand=acom

We can e-mail the you also the package later today if you just ring us up
or email a request.
Acom should post the downloads on their website. It should not be a hard
thing to do either.

From: Jeff Freedman
Topic: 6891 Message: 6891

Fairly trivial question for the group: I usually power up my 1000 first thing in the morning to work the early DX. May leave the shack for a couple hours and come back.

Is it better to power down the amp when I'm gone and power up on return; or just let it sit idle during that time?

Appreciate your thoughts.

Thanks and 73 - Jeff K7JF

A tube's filament is stressed each time it is turned on, same as an incandescent light bulb. I use my 2000A once a week. If I even think im going to operate it again that same day, I leave it in standby, with the filaments hot.

The Acom 1000 rear power switch only turns on the low voltage supply to the logic and display so leaving it on is not a serious current drain or cause of wear but it doesn't provide any useful functionality other than enabling the main electronic power switch (and reading fault codes I believe). I always turn mine off when not in the shack as it seems to be a waste of electricity even if it is a small amount.

I would never leave the HT and heaters on for extended periods when not operating, although the filament lifetime is shortened by power cycling I doubt that it is a critical wear factor given that most devices eventually fail from HT shorts. Also I would guess that the electricity saved by turning off for extended non-operating periods e.g. when not in the shack would cover the cost of device replacement several times over.

6900. ACOM 1010 fuse blows

Yahoo group: acom-list (2010 — 2016)
Date: 2015-11-29 23:20:07 UTC
From: davenlr@...
Topic: 6900 Message: 6900

I have an issue with my 6 month old ACOM 1010.

The supply voltage is set to 240V. My actual line voltage is 247V.

The amp powers up fine, tunes fine, transmits fine. Then at the end of the day, I put the amp in stand-by, and flip off the front panel power switch. About once every 3 months, when I power it off with the front panel switch, it immediately blows both line fuses on the back panel.

Does anyone have any suggestions as to what might be causing this?

Hi Dave,

Try to put a backups between the amp and electric line. You need a big one but you will see if it is the electric line or an amp issue.

My 2000a is protected by a 2700va backups and no problem. Just i can’t use the full power of the amp but i never do it.
1010 need less power.

The only 240V line conditioners I can find are for the whole house, and very expensive. If it is the extra 7 volts on the power line, would I be better off just retapping it for 120V and using a dedicated 120V power line? I could do that easily by switching out the plug in the wall, and rewiring the breaker.

OK, I see that unit. It runs off mains voltage until mains voltage drops out, then switches over to UPS...so I would still be getting a full 247V. There is a unit on Amazon by trippLite that actually converts the 247vto DC, and then reconverts it back to sine wave 240 filtered output, but the price tag on that is $800, WAY out of my price range. I will keep looking.

FYI, if you have not seen them before, the input voltage specs for the amp are:

h) Primary Power: 85-132 V/170-264 V ac (100, 110, 120, 200, 210, 220, 230 & 240 V nominal taps), +10% -15% tol.), 50-60 Hz, single phase, 1200 VA.

OK, the distributor seemed the think it was caused by overvoltage, but from this spec (thanks) its not being over-voltage supplied, so Ill ask, what could possibly blow both fuses by turning off the amp? A short or bad power switch? I do noticed when I power it off, all the leds on the front panel flash. This happens so intermittently, Im not sure what to look for as a cause.

Turning it on, and running it, even up to 900 watts, causes no blown fuses.

Dave

The Amp specs are consistent with the US Standard for power distribution systems so that part is OK.

I do not own the amp so I am not familiar with its characteristic or circuitry (I do own an ACOM 2000A which has worked fine for many years with a nominal voltage of 246V).

If the problem always occurs when the power is being switched OFF and not when it is switched ON (the most likely time for a fuse to blow), there is obviously a current surge that is being generated when it is cycled OFF (could it possibly be that the contacts are bouncing?).

If you cannot identify the cause, the “rule-of-thumb” to replace the “cheapest thing first” suggests that you should try replacing the power switch first (just a shot in the dark).

Dave

Is this a new amp or second hand ?
Check the value of the fuses, not only the Amperes but also the type, in the power supply there must be 'slow' types used.
In the manual you will find value and type.

Other reasons for blowing these fuses :
- bad transformator
- bad relays in the current limiting circuit
- bad or shorted capacitors in the power supply

I have once repaired a 1010 with who blows the fuses. The problem was a shorted blocking capacitor in the rf part, I htink there are two of them.
I could not see anything on that blue capacitor, after desolding I could see a black spot on it.
So the power supply was shorted to ground.

I have posted this earlier in aug. 2014.

Hope this helps

This was bought new, less than a year ago.
The fuses are factory installed inside on the power supply. These have not blown.
In the manual it says to use For 240 V: 6.3 A 250 V 5 x 20 mm fast (quick blow)

That is what I am putting in the amplifier. It is the mains line fuses that are blowing when turning off the unit, but only once every three months or so.

I notice when I power the unit off with the front panel switch, all the LEDS flash on for a second.
When I just pull the line cord out of the back, they do not do that. I am suspecting a back switch.
Still have not received a return phone call from Array Solutions to confirm.

Thanks,
Dave

I have had this problem with my Acom 1010 also. I happened when I tried to turn off the amp and did not complete the toggle of the switch, it then returned to the on position and blew the fuses. I always make sure that I firmly switch the power switch to off to prevent this from happening again. It appears to be a faulty switch, in my opinion. I think Acom should be made aware of this, now that it appears to be commonplace for the Acom 1010. After reading the posts here I will contact Acom and make them aware of the problem. I would recommend that anyone having this problem to do likewise.

My 1010 is wired for 240v and the actual voltage is around 246, but I've had zero trouble with it. The only mod I've done is the fan mod to speed up the fan and keep the tube cooler. (Jumper resistor R35A, 33-ohms, 1-watt on the Mains board.)

This sounds suspiciously like a bad main power switch, especially since you're not having any other issues plus it being intermittent. Also since as you say this is happening coincident to turning it off, I doubt that a surge protector would be of any help.

Dave,

If it's a brand new amp , contact the seller or Acom ?
I read the manual but i see no reset-procedure.

Be sure that the main unit and the display are properly connected.

Yes, brand new. All connections checked. This is my friends amp. I have one and helped him hook it up.

The dealer is sending out a replacement amp. I was hoping it may be something simple.

Hello,

Since yesterday 00.00LT we are allowed to use the 60 Meter band, between 5.350 and 5.450 kHz.

My Acom 2000A won't work on those frequencies. Is there a modification available?

Tnx and 73, Hans.

Ummm...

60m Power change: The effective radiated power limit in the 60 meter band is raised by 3 dB, from 50 W PEP to 100 W PEP, relative to a half-wave dipole. That of course, if for the US. I do not know where to find the rules for other countries...

You would have to retap either the 80 or 40m bandswitch position on the coil to 60m location on the coil, or buy a new bandswitch with extra positions and run a new tap between 40 and 80 for it am thinking.

While I have not tried it, it is totally possible it might load up using the 40 or 80m bandswitch position. Worth a try.

Acom 2000 don't work between 4,9 Mc and 6 Mc . I did acqiure some info from Acom. Maybe a manual adjustment in the Acom 2k wil help ?
Maybe to select manual a band nearbij the 60 mtrs and manual tune with Acom 2000 ?
Just a thought..

A fellow amateur did hear an amateur on 60 with a Acom 1000 with the switch to 80 meters ....
If it's treu.. i do not know..

Just as a side note... I had some arcing problems on the spring fuse end in the past using metric (6mm x 30mm as I recall) fuses in my 2014 A-1000 that were resolved by going back to US spec 1/4" x 1.25" (6.35mm x 31.75) fuses. This was a surprise to me and I now have a large excess of ceramic metrics ;-(

Maybe I'll swap the fuse sockets out someday.

From: joe_word@...
Topic: 6936 Message: 6936

After reading the 2000A on 60 meters thread, I tried my 600S on 60 meters. It works just fine in the 40 meter position. 5 watts in from my Flex 1500 gets 100 out of the 600S and it will automatically select 40 meters if I send a 5 watt carrier from 60 meters. I made about a 30 minute QSO and it worked perfectly.

ACOM 1500 160-6 meters amplifier, S/N 140231. This unit has less than a dozen hours of operation; 10/10 physically and electrically. this unit is currently never turned on and used as a backup amplifier to my ACOM 2000, which just never fails. The true resistance indicator
(TRI) tuning aid is a visual indication for adjusting the controls and makes band hopping with the ACOM 1500 quick and easy. Three antenna output selections for multiple antenna installations. Uses a single, readily available, 4CX1000 tube.
So treat yourself to an early Christmas present for only $3295.00 and save over $700.00 including FREE shipping in original double boxed packing to your CONUS QTH. Read the review in June 2013 QST. I'll accept PayPal (preferred), USPS M.O., or your cleared personal check for $3295.00. No picture shown, as there are several on any of the authorized dealer sites for a NEW amplifier with the same or equal quality to this unit.

The difference is continuous tuning *3* to 30 MHz.

You give up below 3 MHz to get all the “in between” frequencies.

Stew GW0ETF/GW4J,

My ACOM 1000 is equipped with a metal screen with close or fine mesh.
It seems to work well.

I use what we in the States call a shop vac (vacuum) on it from time to
time. When I was last inside the amp, there was no accumulation of
dust. There are no fiber or paper filters inside the amplifier. The
metal screen is the only filter my amp has.

Thanks Jerry..

Well like I say the grille on the intake of my amp is no more than a finger guard rather than a filter, and I assumed this was the norm as it's exactly the same as one of the photos on the http://www.hfpower.com/ http://www.hfpower.com/ web site.

Having said this there are no signs that the air flow is anything but normal. But looking inside the case of my tower pc got me wondering what happens to the dust getting inside the amp..

Hi Stew,

My A1000, 2006 vintage, has the same fine mesh metal filter as that mentioned by Jerry. I nearly made a big mistake by trying to remove it for cleaning. The nuts are NOT captive and as soon as I noticed it I was fortunately still able to tighten the screw down again. I would guess it will be the same for your finger guard.

Later I installed the the additional fan and to get to the nuts you have to remove the transformer, a pain to say the least for the lack of captive nuts. I fitted the finger guard on the inside of the cabinet (RF screening) and the fan on the outside with suitably short screws and then with similarly short screws fitted the mesh filter to the fan. Thus I am able to remove that mesh filter for cleaning if I wish without having to dismantle the amp. I didn't have a source for a suitable clip-on filter kit.

Acom say they didn't use captive nuts because anyone deciding to install the extra fan would have to source metric screws! A damn site easier and less hazardous than having to remove the transformer methinks.

Regards,

Mike VP8NO

Hello

Just a note to say my new (this summer) Acom 1010 failed in that I left it on but with the 'OPER' switch off on standby and had lunch. On returning the amp was dead. Return to seller and the fault was an overheated fuse inside which had degraded the fuse holder. Not good news, but it is back and working well. Just nervous as what happens next. No actual faults identified otherwise.

I would like some advice on how to use it with reference to the advice to leave it on standby rather than switching it off for short breaks. The manual says that too much turning on and off will shorten tube life.

How do users act on this? I am tending to leave it on standby for say a couple of hours when off doing something else but when I know I will be back in the shack again.

Is this the right way to operate the amp or is it safe to turn it off if only for say an hour and then on returning to the bands re-switching it on again? Not had this issue before.

From: k0bx@...
Topic: 6953 Message: 6953

I have been thinking of buying a A600S for Christmas. Checking around I see that Ham Radio Outlet had a $200. discount for this amp over Labor day. But for Black Friday, the only discounted all the other ACOM amps except the A600S. No discounts yet for Christmas.

Looking at HRO's website it looks like there only have one in stock at one of their stores. DX Engineering Website says in stock.

I am wondering if available is a problem?
I am also looking at the Elecraft KPA500. It is priced at $2299 VS $2794.95 for the A600S. I am just wondering if it is worth $495.95 more the the A600S.

HRO maintains stock only in VA and ships as needed.

Joe:

I've owned them both. I still own the KPA-500. More bang for the buck. The 600S is really nice and I had no trouble with it. I'm a big Acom fan. Own the 2000A. Owned the 1500, and the 1000.

Joe,

I cannot speak for the Elecraft as I don’t own one. I do own two A600’s amps and I am extremely happy with them. I took one to Africa in September and even with very fluctuating line voltages over there, the amp worked like a champ. It can handle fairly high VSWR too, plus no need to change taps internally to change from 110v to 220/240v. The amp is well protected too. Solid 600w with very low drive.

I have the 600s and am very pleased with it.

The one thing that I really like is that it follows my Icom on band changes either through the radio or MLDX with no problems without the gremlins reported by many about the Icom CIV buss. I monitor error rates through MLDX and error rate is always next to zero.

Don't know about the Elecraft but seems like a fine amp from reviews.

Hi Bruce, I think I've worked you a time or two.
You said "More bang for the buck"? Did you mean the KPA500 or the A600S?

I have a Ten-Tec Centurion as my amp now. But I only run it at 600 or so watts living in a subdivision. I am tried of tuning up each time I switch bands.
I am using a Flex 6300 for my rig, and it would be nice to have a easy setup to use.

Topic: 6948 Message: 6959

Stew, Mike, and all,

I will add one more strand to this thread.

My air intake filter has fine wire mesh that has openings of approximately 0.64 mm or 0.025 inch as measured with a wire gauge. My experience came after privately buying this used 1000 amp which needed a new GU-74b tube. (Thank you, Jay @ Array Solutions for your expert assistance and counsel.) When replacing the tube, I chose to add the auxiliary cooling fan because I do some RTTY contest operation; and I did not want to repeat the process.

Yes, the nuts holding the filter are not secured. As I recall, three (3) nuts are accessible with some care. The fourth is retrievable with a magnetic screwdriver; and I did not have to remove the transformer. Now, I chose to mount the auxiliary fan with 3 out of 4 screws and nuts. I believe I used some tape to hold the nut(s) in the more difficult location(s). That fourth location down behind the transformer ... I gave it a couple of attempts and then gave up. Yes, after three out of four. I cried, "Uncle." It was probably give up or remove the monster.

So how does it play? My ACOM 1000 does a great job on CW, SSB, and RTTY, and extremely quietly too. With 32 - 37 watts drive, my exciter makes much more fan noise than my ACOM 1000 with two (2) fans does. That is the honest truth.

I have seen posts here that have claimed to run 1000 watts on RTTY. I received some expert technical advice/assistance that included caution about running a full KW on RTTY for extended periods. The manual which came with my amp is not really crystal clear on the power rating issue. I have decided to exercise virtuous self restraint on that high duty cycle power issue. Maybe it's not so virtuous. It is more like selfish in that I don't want to have to buy and exchange a tube again or a transformer anytime soon. Perhaps I am over-cautious.

I hope these comments are helpful to the group. I am really enjoying this amp thus far.

Best wishes for a Merry Christmas
and 73,

Jerry K7VIT

Jerry,

I frequently do runs on RTTY and with the amp set for 6-700W indicated the air runs at 54-56C. I fitted the extra fan to aid cooling of the transformer but it also brought the air temp down about 8C which is a reasonable result.

I did some tests a while ago which indicated that the tube generated most heat in the 300-600W output range. I have used to amp at 900W indicated during lengthy 6m JT65 EME skeds without the blower needing to throttle up.

Regards,

Mike VP8NO

Mike,
I have also run short periods at higher power for DX RTTY QSO exchanges, but a lot of my operation is in RTTY contests where I throttle back like you. I haven't tried any of the WSJT modes yet.

The person who provided that expert advice also said the 2nd fan, in addition to adding cooling efficiency to the path leading to the PA tube, also provides extra cooling for the transformer. I have never heard it get above baseline speed. It may have, but I haven't heard it. :-)

I have not inquired about the price of a transformer, but I have my suspicions.....

Again, I am really happy with this amp. Plus it's almost like video-games--I get to look at all those parameters to make sure everything going smoothly. Love it!

Jerry

I have had the sad reality of a busted transformer. This was after nearly 10 years of operating under contest conditions. At the time I used a pair of these amps in a modest SO2R setup. The transformer is in the US$360 range and of course shipping is a whole 'nother matter. In the end it cost about US$500 inclusive of express shipping to 8P.

I rushed and sold the still operational unit and explored a number of options but in the end I will almost definitely go with another A1000 or maybe the A1500.

The A1500 transformer can also be used for the A1000 but it requires some modifications which seemed reasonably simple but which in the end I opted not to pursue. I think the main thing was that new holes would need to be drilled to facilitate slightly different spacing and if i remember a slight change in the wiring harness but i am speaking from my recollection of dozens of exchanged emails a few years ago. One of the voltages might also have been higher on the A1500 transformer and the ACOM techs had a simple solution for that. Anyway seemed reasonable easy but I ended up with the cheaper plug and play solution.

FWIW the transformer that failed had a fault in the HV circuit with some breakdown of the insulation within the transformer windings. Interestingly the external fan had been installed on both units.

Hope that gives some perspective.

Peter,

I think this failure you experienced was just a one-off fluke event. I use my Acom 1010 throughout the day literally every day, sometimes leaving it on for many hours. Other times I will turn it on and off 2 or 3 times a day, yet never a problem. Sounds like your power switch may have arced one time and then developed a carbon path that caused repeat failures..

My only issue is a lot of pet hair and dust collection under the tube socket and around the blower inlet. We have 2 dogs and 3 cats, all house pets. I cut some filter material to fit under the amp by the air inlet holes which seems to help a lot, but I still have to pull the cover and blow it out with compressed air about every 3 months, but operationally I have (so far) had no issues. I have had mine since last April (2015) so it's only 8 months old, but working perfectly.

To my knowledge there is no history of owner issues with the Acom 1010.

Hello all,
I have an acom 1000 that is working fine but I noticed that when looking at the plate current on the display
It always shows the same plate current no matter where you put the tune or load controls.
It does change however with the amount of drive.
I also noticed that there is never any screen current indicated even if the tune and load controls are moved.
Is this a normal thing or is there a problem with the processor board?
All other reading work fine.
Thanks,
Don W9BHI

So ACOM 2000a has been working just fine. Then one day I start it up and after about 10 seconds the message "Microprocessor Conflict" comes on the screen.
What to do?

When I had my uP Conflict problem (2014) I jumped thru a lot of hoops and eventually was in contact with Val in Bulgaria, he had me check fuses, interconnects, interlock switches, be sure cover compressed the interlock switch, etc., etc. What I think worked was changing 6 caps (3 on RCU, 3 on CPU)*, also button battery on CPU.

* CPU: C4, C6, C7
RCU: C23, C14, C15

I do not have an electronic copy of our correspondence, but do have hardcopy in my ACOM file, could FAX to you if you need it.

6978. Dial position when LOAD Capacitor is fully-meshed?

Yahoo group: acom-list (2010 — 2016)
Date: 2016-01-01 10:43:36 UTC
From: d48806@...
Topic: 6978 Message: 6978

If any of you Acom 1000 folks currently have your amp cover off, can you tell me the following: When the LOAD capacitor is fully-meshed (max capacitance), is the front-panel dial at 0 (min) or 100 (max) on the UPPER scale?

I keep getting conflicting reports on this. My amp is very difficult to remove from it's resting/operating spot!!

Mucho TNX !!

6979. 1010 Blown Fuses

Yahoo group: acom-list (2010 — 2016)
Date: 2016-01-01 16:57:52 UTC
From: evetsmd@...
Topic: 6979 Message: 6979

Really got my attention (big noise) when an 8 day old 1010 blew both primary line fuses.....one of the fuses just shattered and the only thing left was the end caps and a charred fuse holder, the other fuse blew but held together....the 1010 was in stdby and all this happened when I turned off the front panel power switch....

looking thru the topics, I see a number of other folks have had a similar problem and have pointed to a defective switch.

HRO is helping me work thru this issue but I have to say this it not a good first purchase acom experience.

I've been looking at the 1000, there is a big difference in fuse holders, power cord and what looks to be a more substantial power switch.

Anyone have experience or advise about this problem....I'd appreciate hearing from you!

Make sure the dealer installed the correct line fuse, depending on what voltage your amp was set-up for. My A1000 had the wrong size fuse installed by the dealer, a 10amp instead of a 20amp (mine was prewired for 120VAC, not 240VAC). Took mine about a week to blow after I started using it (low duty-cycle on SSB?).

6981. Tune_Load Caps

Yahoo group: acom-list (2010 — 2016)
Date: 2016-01-01 23:46:48 UTC
From: Mike Harris
Topic: 6964 Message: 6981

Extract from Acom doc re removal and replacement of the A1000 front panel:

<quote>
a) Set two variable air capacitors to maximum capacitance (closed).
Align the rotor- and stator- plates edges evenly in a plane. Thread one
knob on the upper shaft (TUNE). Orient the knob mark to point to "100"
on the scale. Holding the knob with one hand, tighten its nut properly
(take care not to turn the shaft meanwhile). Then check that the maximum
(closed) position is indicated by a "100" on the scale. Put the black
plastic cap and press it gently until it locks. Repeat the procedure for
the bottom knob (TUNE).
<unquote>

This is what I did when I replaced the LCD and the previously recorded
Band/Tune/Load settings matched.

Regards,

Mike VP8NO

This procedure might be incorrect, since the LOAD and TUNE caps are supposedly 180-degrees different from each other (from what Array Solutions has told me). This procedure says the two are the same. So, something is amiss somewhere!!

I have been told that the max-capacitance (fully-meshed) on the LOAD capacitor is with the pointer at MIN (zero) on the UPPER scale. And that the TUNE capacitor is just the opposite. Trying to verify that !!

In truth it doesn't really matter what the relationship is between the actual caps and the numbers around the knobs. The only thing that will not agree is the typical tuning preset settings in the handbook, you will have to determine your own which isn't difficult with the TRI system.

All I can say is that my actual settings agree more or less with the info in the handbook. They did before I dismounted the front panel and they did after I remounted it with the caps/knobs set as per the Acom instruction.

The choice is entirely yours as to how you set it up, Acom standard, Array Solutions standard or whoever you are standard d48806.

Date: 2016-01-03 10:55:56 UTC
From: evetsmd@...
Topic: 6985 Message: 6985

Has anyone removed the feet from an Acom 1000....I have a space/shelf that is only 7.5" high and I would like to slide the amp into it! The specs say it's 7.2" high but a friend has measured his and say's it 8.5" high so I'm assuming 7.2" is without the feet..... Tube ventilation will be OK! I'm waiting delivery so just trying to prepare ahead of time.

What I'd like to avoid is unscrewing the feet and then having nuts loose and bouncing around inside the cabinet.

Thanks

Steve

Interesting, I've just measured my A1000 and it is 7.6" (19.3cm) including feet. There are some pretty chunky screw heads projecting below the cabinet base (transformer fixings) so removing the feet does not result in a flat surface. I would offer that tube ventilation will NOT be OK assuming I am reading your desire to slide the amp into a shelf space, the hot air exits from the top of the amp and there is a lot of it. Heat kills electronics.

Regards,

Mike VP8NO

Lawrence,

It should not make any difference what RCU you have.
I auto tune my 2000As to the center frequency of each ACOM band segment.
If you need to know those segment boundaries, just download the 2000a manual from the Acom website.

73,
Bill N3RR

I guess the Acom 2000P will do the job.
I wonder what is the internal difference? Just firmware?

Can we convert a 2000A into a 2000P just flashing the firmware??

Hello Zoli,

It is 100 Watt output what we are allowed to use in Netherlands.

My KX3 has 10 Watt output and I wanted to use my Acom 2000A for it.
Unfortunately it does not work on 60 meters.

73, Hans.

Thanks Dave.

I will ask Acom which is the best way to handle.

Manual tuning did'nt work either Hans. Unfortunately. I have an Elecraft KX3 with 10 Watt output and wanted to use the Acom 2000A on 60 meters too. Never mind; I try my Alpha 91b; perhaps this will tune on 60.

Ummm...

60m Power change: The effective radiated power limit in the 60 meter band is raised by 3 dB, from 50 W PEP to 100 W PEP, relative to a half-wave dipole. That of course, if for the US. I do not know where to find the rules for other countries...

You would have to retap either the 80 or 40m bandswitch position on the coil to 60m location on the coil, or buy a new bandswitch with extra positions and run a new tap between 40 and 80 for it am thinking.

While I have not tried it, it is totally possible it might load up using the 40 or 80m bandswitch position. Worth a try.

Hi Bob,

Well, you loose 160m but you get 60m, plus any other freq in between 3 and 30 MHz.

A request/wish for future upgrades (on 2000P), to cover from 1.5 to 30 MHz ;-)

6997. ACOM 1000 blows fuses when going to OPERATE

Yahoo group: acom-list (2010 — 2016)
Date: 2016-01-16 17:34:41 UTC
From: Jose V. Gavila
Topic: 6997 Message: 6997

Hi all,

I am working on a faulty ACOM 1000 which blows both rear panel fuses when going from STAND-BY to OPERATE.

There are 7 signatures stored. The 1 to 6 are all of the same kind, during STAND-BY (SB type), as this one:

1ASB2B 000000 000000 1BB494 0320DE D77FF8

THe sheet shows 'During StandBy ORC'

The 7 is entering operation and, even if the Excel sheet reports a 'REFILL' error, it seems to be ipm related. The full signature is:

7APR06 000000 00003D 7B249F 6720DE D77FFE

(I have got other similar signatures on that position and always generate the REFILL error)

That shows an ipm of 305mA and the red words shown on the Excel sheet are "Entening operate ipm'

I have already blown two sets of fuses and the error codes are always similar.

So, could you give me some advice regarding the possible faulty components?. Tube, HV cap, ??? ?

Thanks and best regards,

Jose

Dear Jose

As I understand the rear fuses are blowing when the amp goes in operate mode after warming up.

Then you can suspect two things:
a: the screen supply : short circuit on a board e.g. the screen supply
b : the tube : there can be internal short between kathode and screen, or screen-anode short

does it happens without a tube in the socket ?

Dear Dirk,

Well, exactly what happens is that the amplifier ends the warm up period properly but then, when you press the OPER button, it immediately blows the fuses.

I have not yet opened the amplifier, so it happens with the tube on its socket.

Regards,

Jose

Hi all,

Thanks for your comments.

Well, I have opened the amplifier and taken the tube out. I don't have an spare tube right now but, powering it up without the tube (but with the covers on, of course) the fuses don't blow when OPER button is pressed after the warm-up period.

So, yes, it seems the tube is shorted!

Now the obvious question... where would you source a new tube?. Is it better to get it from ACOM?

Thanks and best regards,

Jose

Jose

I would try it with no tube in the socket and see what happens. Take care that the anode clip make no shorts or disconnect the wire to the anode clip at the hv board.
If the fuses does not blow then the tube is the cause.
Attention: lethal voltage inside !!

You can check a faulty tube with an ohm meter for shorts. But most of the shorts happens only when the tube is warm, then the hot kathode is bending due to thermal deformation towards the screen or the screen to the anode.

I you are able to put the kathode voltage abt 12.5 V on an tube on youre desk, this for abt 5 min.or so while then the tube will become hot. Take the voltage away and put the ohm meter on for checking shorts.
If you apply the voltage for more time you need a ventilator to have so air flowing on the pins of the tube.
Attention: the tube will be hot !!!

You can try another NOS tube, you can check this tube before for any shorts the same way as above.
NOS tubes must be gettered before using in the amp, there is usefull information about that in the file section of this forum.

I have the following cables that are no longer needed that interface with the 2000A:

1. 15 pin male VGA from the Remote Control Unit to a 9 pin female serial connector wired for Kenwood Radios. Used so that amplifier can track the band that the radio is on, without using RF sensing.

2. 15 pin male VGA from the Remote Control Unit to a stereo 3.5 mm 9 pin connector wired for the Icom CIV. Used so that amplifier can track the band that the radio is on, without using RF sensing.

3. 9 pin male to 9 pin female serial cable connecting the amplifier with your PC.

4. Control cable between the 2000S switch console and the switch itself. 10' long.

If you have a need for any of these, please email off the reflector. My email is good on qrz.com.

David. You just connect the REMOTE pins (check manual) with the PTT line of the amplifier.

You can buy the cable on internet too.

Does that help..?

Hi David,

connect REMOTE pin 2 (COM) to the amplifier GND and pin 4 (MKE) to the amplifier PTT IN connector.

Hello Bill, thank you very much for responding, I want to be sure what I'll do, so I have more questions.

TS-590 ACOM 1000
REMOTE

Pin 2 COM ======>> GROUND

PIN 4 MKE ======>> KEY IN = PPT IN

1.- ACOM 1000 on RCA connectors are used only the center of the RCA? I think only the center is used.

2.- Cable wire?

Please, I also need the connection to my ICOM IC7600, someone working with ACOM 1000?

HI Peter
I have an acom 1000 that I use with my icom's 746, 756, 9100, I use a mast head pre amp so I had to use a foot switch so it takes the pre amp out before TXing, I wanted to use it with the signalink interface for digital work but it would shut the amp down as it was hot switching, I look every were and could not find anything to help me, so I thought about it and decided to LOOK in the signaling interface box and thought, I would cut into the ptt line and the ptt ground, I run a lead out to the acom 1000 key in line and bingo it works, I could never run brake in or qsk keying before, I could never run CW unless I used the foot switch but now every thing works great.I still don't understand why it would not work before, and why the acom company dose not explain it, I have been using the foot switch since I had it some years.I don't know if this will give some idear,s .

Hi Larry
I am using a usb signalink interface and found that when using digital modes you can not sit there waiting to push the foot switch as the amp will shutdown with the hot switching, so I opened the interface box there is a jumper strip all I did was melted the plastic on the jumpers PTT & the PTT Ground I soldered a line and ran a lead direct to the key in socket on the amp with a RCA plug.I had no idea if it would work but bingo I don't have to use the foot switch for cw and I can even use qsk with vox, I could never do this before.I still don't understand how it works, I don't even use the line from the radio at all.I only wish some one put this on the net it would have saved me a lot of trouble.
I hope this helps you

The signal link generates the ptt using a vox circuit on the digital audio. So your mod is keying the amp at the same time as the radio is keyed and that's what you want.

Hi Clive

The paint is not avalable from ACOM. I received this info directly from ACOM sometime ago for my 1010. I think 1000 is the same. Go to your local car paint supplier or body shop..

73 Dany VE2EBK

Message received from ACOM

We do not offer a touch up paint, but our color is RAL # 8019 Mat.

A fast Google search gives following link:

http://www.lowvolumepowder.com/RAL-8019-Touch-Up-Pen

When that happened to me, it was a bad tube. Just under one year so Jay replaced it for free. Finally got K5P on 80, 30 and 12, the only bands that I needed them on, with not a minute to spare, as we are almost in Vegas.

From: Bob Naumann
Topic: 7033 Message: 7034

It sounds like your K3's Key Out line is shorted.

What happens when you disconnect the cable from the RCU Key-In connector?

Just a reminder - you MUST have *both* the Key-In and Key-Out cables from the RCU plugged into the back of the amp to their corresponding RCA jacks..

73,

Bob W5OV

From: John Bates
Topic: 7036 Message: 7036

I received my Acom 600s 2 days ago and all checked out except Keying up with no input the PA DC Current should read 1 to 1.4 Amps.

Mine reads 0. When I transmit with power it reads 20 Amps. This shows me no Idling current.

Options;

Do I let Acom repair it by sending it back to the seller?

Do I send it back and buy a 1500 instead?

Thanks for all input.

John

I can understand just how frustrating it is to purchase a new item and have this happen. I suggest the obvious call, and be very firm.

They, ARRAY Solutions do, for a limited fee, provide a pre-sale test burn in.

Best Regards, Ira ke4ex

If you purchased it from HRO, they will exchange it for you and send you a new one after they received yours back.

Talk to the national sales manager.

You might send Acom Bulgaria a quick email describing your problem.

Hi, I sent for a small touch up pot from a UK supplier called paint express. If you just search for that ref for the paint, I'm sure you'll find a local supplier.

7041. issue with AC voltage regulator

Yahoo group: acom-list (2010 — 2016)
Date: 2016-01-25 18:08:21 UTC
From: iz0kbr@...
Topic: 7041 Message: 7041

I have a 2000a tapped at 240V. The main voltage at home is around 224/225V, rarely during the day it reach 230V, and when I excite the amplifier from the transceiver the RCU shows 210/200V and less and the Heater starts lighting: this is the normal use of the amplifier for many years, and nothing wrong happened till now, but the Heater warning it starts to be annoying.

To try to fix this problem and optimize things, a few days ago I have decided to install an "AC automatic voltage regulator", and now the RCU shows 232/233V constantly in standby mode, which it is perfect, but when I operate the amplifier the RCU shows 245/250/260V or more and the Heater starts blinking up to when the amplifier goes into protection mode saying 'MOTOR VOLTAGE TOO HIGH': the more power I load from my transceiver, the more main voltage value is shown on the RCU.

i.e: 10W load: 240/245V, 20W load: 250/260V, 25W load: 270V + amp in protection mode.

It should be noted that while the RCU shows 260V or more, the lcd screen of the AC voltage regulator always shows an output voltage to the amplifier of 232/233V, which is correct.

What is wrong?

7042. Re: issue with AC voltage regulator

This can be better answered if we know the model of your voltage regulator. There are different technologies used, and some can change the sinusoidal waveshape of the AC line, which is undesirable.

hallo

I have no experiences with voltgage regulators.
The 2000 draws a lot of current, a 2,5 mm² home grid is a minimum.
I do known how long the wires are are in the home grid, I see from your measurements there is a big voltage drop.
Therefore is this voltage drop due to the grid coming from the supplier, you can measure this
at the entrance or is the voltage drop in your own grid. ?

The peak currents in the circuit feeding the amp - and maybe the shack - is big.
The capacitors in the amp power supply have to recharge wich is almost a short cuircuit.
An 1,5 kW output amp, has about 3 kW input , on 240 V that is about 12,5 A (RMS), but there are peaks of about 150 Amps due to recharging the power supply.
You can improve the home grid by using 4 mm² or 6mm³ depending on the length of the wires from panel to the shack.
The fuses in the breaker panel can be 20 A type C just like for a 2,5 mm² wired circuit.

From: garfieldbill700@...
Topic: 7045 Message: 7045

Well crap. If ever there was a case to have an air-flow or temp monitor on the 1010, this would probably be it. Running CW last night on 40m & got carried away w/long transmission, smelled something hot then noticed that my 1010 had Red-Lighted me. The shack was fairly dark to begin with and the amp sits on an end-table to the left of my operating position, somewhat out of sight. I failed to notice that a black 3-ring binder had been laid on top of the amp, covering the exhaust vent. Aww-s**t. The fault cleared but immediately red-lighted again when keyed. I let it cool down, but same symptom.

Assuming it was the tube, today I installed my spare, let it getter for a while, then set the bias and we're up and running again, albeit an expensive lesson. I like having a spare tube on hand, just hadn't planned on using it quite this soon or for such a very stupid reason.. I'm guessing the original tube is shorted.

What's the going price and best source for a GU74b these days? I'd still like to keep a spare on hand.

Thanks
Bill - WB9FOP

Thanks Dave! I rec'd an email this morning from Vine Antennas in the UK that they have fully tested and guaranteed ones for GBP 160 (USD $228.60) plus $28 shipping. Compared to untested ones from questionable sources, that's a very small premium for the warm fuzzy feeling of dealing with a reputable firm. Will probably go that direction but still checking. It's not like I'm down and need it overnight.

Thanks

The info that I received from Val thru DX engineering is "The difference is a result of an additional protection that was implemented after the manual was printed. The PA is kept cut off until the transmission start when the driving signal frequency is countered and the band is switched if needed. This is if the CAT is not being used.
Makes sense to me. Thanks for the inputs.

We have a new ACOM 1500 amplifier at Array Solutions, our last one.
We will sell it for less than retail and it includes free shipping to lower 48 and two year warranty on amp and 1 year on the tube.

This amp includes our check out service, and set up 240 VAC, and the AC Main Plug.

Please call us if interested.

This must be a joke. I can't believe that somebody will buy a voltage regulator when he can simply change the taps according to the mains voltage. Why do you torture the poor ACOM 2000A set on 240V after you know that in your shack it is 225V and sags even lower under load?

Remember that the tubes like it hot. It is better to keep them hotter than colder as the low filament voltage shorts tubes life. If you have 230VAC, set the PA to 220V and not to 240V.

Hi,
I plan on getting an amp for HF. I really like the 1010 from what I've read so far. I don't have any experience with tube amps as a ham, but I was was servicing HF-transmitters in the military in the early 90s. I remember replacing a lot of Y-757 back then. How long do the tubes actually last in these Acom amps, let's say if I'm on the air for an hour a day on average, doing cw with 300 watts or ssb with PEP 600 watts? Should I expect replacing the tube within 4 or 5 years?

Topic: 7056 Message: 7057

Considering the tube in the 1010 is the same same tube used in their 1KW amp, the tube is already taking it pretty easy on the 1010. If you dont run a 3:1 SWR constantly, i.e. keep your reflected power to a minimum, dont use full power key down modes like RTTY a lot, and follow normal maintenance on the amp by keeping it clean inside and out...the tube should last a long long time. I would think your expectation of 4 or 5 years will turn out being a lot longer than that. My last amp with a pair of 572s was still putting out full power after 15 years when I sold it.

Watch that screen current (keep it low, with proper tuning). Also, I have heard that off-on cycles with the filaments are harder on the tubes than continuous hours of operation.

Under normal circumstances, it all depends on the usage. I have seen Acom 1010 coming back after less than 2 years for tube replacement. After questioning the owner, we knew the root cause: Amp was driven to full power most of the time. Since the HV is trimmed down to allow less quality components in the Acom 1010 compared to an Acom 1000, the tube has to work harder to produce the same RF output levels (not talking about the maximum here). In other words, to produce 400 Watt from an Acom 1010 is less easy for the tube itself than when she is fitted in an Acom 1000 which has a higher HV.

With regards the Acom 1000, an original tube is still fitted in mine, and is still rocking. On the other hand I have replace tubes of Acom 1000 owners when they degraded in performance. After asking the owners at what RF levels these amps were used, each and every time these amps were used to produce the full RF output or were used extensively in a digital mode and maybe sometimes even too much RF input with bad tuning. Mark my words on saying that screen current kills this type of tube in one way or the other. Keep the RF output so low that you do not see any flowing and your tube is and will likely stay very happy. Only in two occasions we could not get our minds on why the tube went bad (bad luck?).

Having this written down, the maximum RF output this tubes was designed for was a) with a lower HV than fitted in an Acom 1000 and b) was 700-750 Watt MAX RF output per specification of the factories. When under the brandname Svetlana the tubes where imported to the USA, all over sudden the maximum HV and RF output values were raised in the new specifications...

Bottom line: If you ask me, simply do not drive your Acom 1000 or Acom 1010 to the maximum RF output, avoid driving the max when it comes to digital modes like RTTY and monitor your screen current closely. Your GU74B tube simply does not like that / cannot cope with these aspects in the long term.

Just my 2 cts gentlemen.

Subject: [acom-list] Re: How long do tubes last?

Considering the tube in the 1010 is the same same tube used in their 1KW amp, the tube is already taking it pretty easy on the 1010. If you dont run a 3:1 SWR constantly, i.e. keep your reflected power to a minimum, dont use full power key down modes like RTTY a lot, and follow normal maintenance on the amp by keeping it clean inside and out...the tube should last a long long time. I would think your expectation of 4 or 5 years will turn out being a lot longer than that. My last amp with a pair of 572s was still putting out full power

after 15 years when I sold it.

That's actually true with most tubes that are subject to intermittent duty. Just like the old incandescent light bulbs that most often fail when being turned on. If there is protection in place to limit filament in-rush current then power-cycling the tube should be less of a concern.

With your fine Acom amplifier, the thing to worry about with constant running is wearing out the fan bearing(s) and sucking a lot of household dust (and possibly pet fur) into the amp, especially if there is no air filter present. I have very neatly taped some filter material to the underside of my Acom-1010 just for that reason, though annual servicing (pulling covers & blowing out the dust) still seems necessary..

But I've also read of several power transformer failures, which considering what these amps cost I think is inexcusable and cause for concern. A power transformer should never fail and the manufacturer should be willing to make good any that do regardless of in or out of warranty simply for the sake of customer good will.

Most transmitting tubes will exceed manufacturer's specifications for power output. The question is, for how long? I've known guys with some cheap Ameritron 811 series amps who can easily get 5 years or more out of a set of tubes. I've known others who go through a set of 811's in a matter of a few months.

I've seen an Acom 1010 consistently make 825 w output on a Bird 43 meter, but not without exceeding the recommended drive power, which is just plain dumb. The difference between 825 and the manufacturer's 700w spec amounts to 0.7135 db which is less than 1/8th of an S-unit, so why do people insist on doing it?

If you want a kilowatt amplifier, buy one. When you cheat by over-driving or worse, by monkeying with the input voltage taps, you're only cheating yourself out of useful life of your tube(s). To quote a famous line, "Stupid is as stupid does."

My Acom2000A has its original tubes since 2004.

All days in use.

Still 14,5 dB gain.

From: iz0kbr@...
Topic: 7041 Message: 7068

hi Dirk, thanks for your hints;

the wiring it should be right, I am using 4 mm2 from the amp to the electricity panel inside of the house, and 6 mm2 from the panel to the panel in the street. The voltage drop that I notice on the rcu while transmitting is present on both panels, infact I am measuring it with a voltage tester.

Last night it was much better, I had 233/235V the whole night (drop down to 222/223V and less only while transmitting), I am wondering if it have a sense to tap the amp to 220V or if the the actual position of 240V is the correct choice.

I read that you have also a soft grid supplied to the house, 6 mm²
At night there are not so many users on the grid and the voltage is higher.
Maybe you can ask supplier to your house to install a 10 mm² wire to suppy the home, wich is more common in EU,

Is there no 230 V tap ? I have no 2000 so I can not check.

If you use the 220 V tap , you need to check the kathode voltage on the tubes while the amps is in stand by mode, this can be done quite easily . Beneath the amp is control panel that can be opened and you can measure there the voltage on the heater. It should be between around 12,6 V, between 11,9-13,3 V is allowed. If you are under 13,3 V you are in a green zone.
Be carefull to measure the voltage on the socket, there are other componentes and tensions close in that little cabinet. You should also check on a datasheet wich socket pins are the kathode.
The filament voltage is the most important factor when setting the taps on the transformator.

Is the fan in the acom 1000 a 2 speed fan? Would it help to have an auxiliary fan installed? What size should it be? 2.5, 5 or 7 watts? Thanks, Richard wb6ewm

7072. Re: fan

Richard

this has been on the forum.
The cooling system is very well built, the internal fan is sensor controlled.

Dirk
on4ct

for the external fan : from an earlier post
have fitted the external fan. Not speced or supplied by Acom.

Sunon DC AXIAL FLOW FAN, 92X92X25MM, 24V
Bearing Type: Precision Ball
External Depth: 25mm
Fan Frame Size: 92mm
Flow Rate - Imperial: 45cu.ft/min
Flow Rate - Metric: 76m³/h
Noise Rating: 34dBA
Power Connection Type: Wire Leaded
Series: KDE
Supply Voltage: 24VDC
Current Rating: 60mA
Current Type: DC
External Height: 92mm
External Width: 92mm
Frame Dimensions: 92mm x 92mm x 25mm
Operating Temperature Max: 70°C
Operating Temperature Min: -10°C
Power Consumption: 2.2W
Speed Range Max: 2600rpm

Works fine and when I'm running an RTTY pile-up the chimney temp hovers
around 56C with 600-700W indicated output. 45cu.ft/min is greater than
the full power airflow requirement of the GU74B (4CX800A):

Cooling air temp 25C

800W plate dissipation - 20 CFM sea level and 25 CFM at 5000 feet.

Cooling air temp 50C

800W plate dissipation - 29 CFM sea level and 35 CFM at 5000 feet.

At 45 CFM for the fan I do not believe it is starving the blower which
being down stream is reducing, or even eliminating, any potential back
pressure which fans do not like working against. I have reused the
original metal mesh filter on the outside of the fan, not having a clip

on foam version.

The 24V fan supply in the 1000 is not regulated and there is an audible fan speed change when going from RX to TX. However, I have no idea what the actual voltage is when on RX or TX.

Regards,

Mike VP8NO

Richard,

Not wishing to hijack Dirk's posting. The fan mounts where the filter is, on the outside of the case. There is a hole in the PCB for the fan wires to pass through to a small terminal block.

If needed I will email a picture and and fan fitting instructions from the Acom 1000 tech CD.

Regards,

Mike VP8NO

From: vk3xq@...
Topic: 7081 Message: 7081

Hi what is the correct screen currant you should be running on an Acom 1000 or the max you should be using ?

Also Dose anyone know if there is a more complete manual other than the one supplied.

Best 73's

Rob VK3XQ

Rob

From the datasheets max screen dissipation is 15 Watts. I think Acom uses about 300 V on the screen so the max. current is then abt. 50 mA.

In the file section you will find a word doc. about the healty condx do use the 1000 amp. This amps trips at 80 mA in the screen, normally the screen current will vary between 10 a 30 mA.
The more screen current results in non wanted harmonics in Rf spectrum.

Topic: 7083 Message: 7083

Please see attached word doc for some really good supplemental info I found.

If you want good tube life, it's best to keep screen current under 20mA.
With proper tuning, it should rarely exceed 10mA.

7084. Acom 1010 Preventing Blocked Airflow - rambling thoughts

Yahoo group: acom-list (2010 — 2016)
Date: 2016-02-11 17:34:11 UTC
From: garfieldbill700@...
Topic: 7084 Message: 7084

Having recently suffered through the embarrassment, expense and inconvenience of losing a tube due to accidentally blocked air flow (inadvertently laying something on top of the amplifier, covering the discharge air vent), I've been mulling over what the options might be to prevent a recurrence.

Acom does not provide any airflow or over-temperature detection and shutdown capability on the 1010. It won't even shut down if the blower quits altogether. There's also little you can do in the way of auxiliary cooling short of laying a muffin fan on top. What's the life expectancy of the little squirrel cage blower in the 1010?

One thing I did think of was the idea of trimming down the silicone rubber "chimney", shortening it by a couple inches down to where it covers only the tube fins, thereby allowing the hot exhaust air to vent into the entire main chassis area and get forced out of the bottom vents in case the top vent stack gets blocked. In normal operation most of the heat will still go out through the top, but this idea seems plausible at least on the surface.

Others' thoughts?

I would have thought the simplest answer is not to put anything on top of the amp and blocking the hole. Venting into the box sounds like a very bad idea unless you want to convert it into a fan oven.

As far as I am aware cutting the silicone chimney is a very very bad idea.

I would be more tempted to install some standoffs on the top in a way that prevents or minimises the possibility of a flat object blocking airflow again.

In the end though it would be best to simply recognise that you shouldn't put stuff on this amp. I have the A1000 (11+ years) and I just never rest anything on the amp. Simple and it works.

If need be relocate to somewhere that makes resting things on it a difficult proposition.

Hope that helps.

Screen current in a tetrode is not necessarily a constant from tube to tube. When I was using 4CX5000A in commercial service, 7.5kW amps, Eimac supplied test data with each tube detailing optimum working conditions.

Screen current can vary so much that screen supplies should be designed to both source or sink current.

For to have a visual control of the air flow you can mount a 0,5 inch wide 4 inch long paper cut in
4 or 5 strips , leave abt 0,5 inch uncut at one end to glue it on the cover next to ventilation opening.
When the strips are covering about 3/4 of the opening in the cover, they will be dancing in the air flow.

with some experimenting with the dimension of the paper and number of strips cut, and even the colour of the paper you will have a very good checkpoint on one eye catch.

For twin tubes amps, you can put the papers on each other and so you will cut the same stripes, you are able to check the air flow in each of the tubes.
Equal airflow means equal dancing.

Thanks all.

The "attraction" is the fact that it's a large, flat surface which we all know tends to attract clutter. My mistake was coming into the shack in the dark and not turning on any lights, as I often do late at night. The computer screen is usually enough light to work by and the amp sits off in a corner off of my left shoulder. But for the flickering LEDs it was otherwise out of sight. Lesson learned, though it does serve to point out additional features of the 1000 that were shaved from the 1010 build sheet. At least the amp wasn't hurt, and a new tube was all it needed..

7090. Acom 1000 moderfing Fan from 92mm to 120mm High Flow

Yahoo group: acom-list (2010 — 2016)
Date: 2016-02-12 06:06:54 UTC
From: vk3xq@...
Topic: 7090 Message: 7090

I have see a lot of talking about fitting a external fan's, I had fitted a 90mm fan to my Acom 1000 with the wire mesh fitted over it, but when using digital mode even with low power things were getting HOT after a long section of txing , I could not understand why Acom could not have fitted a 120mm fan as there is a greater choice to pick from.

I thought about how I could fit one, I was thinking about bending up some thing to do the job.
And then I thought about some thing in PVC pluming bit's, I went to my local hardware shop, I went through all there bit's and picked out all that I thought I would NEED as I am 15 kms away it cost me $62.00.

I went home and believe it I only need 4 bit's.

1 Was a PVC shower waist approx. 92mm square top to a 90mm round bottom It was almost a perfect fit I only had to file it a bit for the fuse and a screw head I used the 92mm mesh to mark the holes.

2 A 90mm to 100mm PVC adaptor

3 A 100mm flange round to fit over a the 90mm to 100mm adapter.

4 a small bit of 90mm PVC pipe.

First thing I took the plastic insert out of the shower waist drilled it to fit the Acom 1000 I use 4 self cutting screws so I don't have to remove the cover for any other work to be done, then I used PVC and glued the flange to the 100mm to 90mm adapter, to get the flange in the place I wanted I used a bity of 100mm PVC pipe.
Once glue set I mounted the 120mm fan on the flange marked around the fan and cut of the bit's to make it square, I drilled the flange and screw the fan on.

The only other thing I had to do is cut a small bit of 90mm PVC pipe to fit between the shower waist and the 100mm and 90mm adapter, I can pull the fan off at anytime just by twisting it, I use an external power supply it suits me

Once I had the bit's it only took about 1 hour

Photo are available if you want more INFO just email me

PS Tanks to those who sent me info on Screen currant on the Acom 1000

Actually, you want none to a very very minimal amount of screen current to be flowing if you really care about your tube.

Hello All,

I had an issue with my 2000A over the
contest weekend!

After changing bands a number of times
I found that the output power was going down!
I had to do an auto retune on each band to get
the power back to normal!

Today (Monday) when I turned on the amp I found
that the power was down again and I had to auto retune
each band to get it back to full power!!!

Any ideas or suggestions very much appreciated....

From: Kenneth Waites K5WK
Topic: 7097 Message: 7097

I have seen Arc Faults when using my beam on 14 Mhz when output is a KW or more.
I have not seen it on other antennas, and it seems to come and go, but now its bothering me.
In the past I have found something like slightly loose coax connections that caused this.
This time I can find nothing.
I use an RCS10 switch at the tower. I replaced it thinking maybe it was arching. LMR400 comes to the
shack from the tower and is used with all antennas. I have the coax connection to the antenna in heat shrink,
so I rate that being a problem as pretty low.
Could there be some kind of flash in one of the tubes? They are about 10 years old.
Any other things you might have experienced?

Ken, the connection at the 14mhz antenna feedpoint is solid? Is the fault in any way related to weather? I say this because my 40m dipole does the same occasionally when it's very wet. I'm trying to think up a solution.

Ken, are you using an RCU? If so, by chance do you use an extension RS 232 cable? I had the same issue on 17 and replaced the cheap, computer RS 232 extension cable I was using with a double shielded cable from L-Com and grounded the RCU. That took care of it. It was RFI feeding back to the Amp and causing a false fault indicator. If its just on one band, it suggests that RFI and something being resonant is at the root of the problem. In my case it was a combination of the cheap extension cable, the overall length and the ungrounded RCU.

Good Luck,

Brent WA0VY

Subject: [acom-list] Acom 2000a Arc Faults

I have seen Arc Faults when using my beam on 14 Mhz when output is a KW or more.
I have not seen it on other antennas, and it seems to come and go, but now its bothering me.
In the past I have found something like slightly loose coax connections that caused this.
This time I can find nothing.
I use an RCS10 switch at the tower. I replaced it thinking maybe it was arching. LMR400 comes to the
shack from the tower and is used with all antennas. I have the coax connection to the antenna in heat shrink,
so I rate that being a problem as pretty low.
Could there be some kind of flash in one of the tubes? They are about 10 years old.
Any other things you might have experienced?
73

From: Jay Terleski
Topic: 7095 Message: 7101

One cause of power changing and the need to re-tune as well as having different drive levels on different bands is the cathodic resistors in older 2000a amps have become aged and they are changing value, even as they heat up in use.

Replacing them is recommended. Older amps used 2 resistors (if memory serves), we change them with new ones with higher wattage vlues and also use 3 in parallel. But the ultimate value is the same as in the schematic for 2 in parallel.

We offer this as a service for older ACOM amps as well as recapping and restoration to original specs.

FWIW, it is not unusual for me to do 5-10 retunes (total) during the course of a weekend.

73, Barry N1EU

You should not need to unless your antennas are changing R and X Barry. My 1998 2000a is solid as a rock for each segment of each band.

I'd look at those cathodic resistors if your amp is old. Please report back.

Jay

7103. RE: [YCCC] Acom 2000A Question?

Yahoo group: acom-list (2010 — 2016)
Date: 2016-02-23 18:21:11 UTC
From: Dick Green WC1M
Topic: 7096 Message: 7103

A possible cause of this is the plate shaft slipping on one or both tuning caps. There's a nut at the rear of the shaft that can loosen over time. If it's too loose, the shaft still moves but when the motor stops the momentum can carry the plates past the stopping point. The motor has no internal brake, so it can't stop the extra movement. The movement can occur randomly, so sometimes you have to retune and sometimes you don't.

The solution is to tighten the nut by degrees until the shaft stops when the motor stops still but moves freely when the motor activates. As usual, ALWAYS UNPLUG THE AMP AND DEFEAT THE INTERLOCKS BEFORE ATTEMPTING ANY REPAIRS.

FWIW, I had the problem with my 2000A, which is an older model. Stan from the factory thought it might have been a problem with the motors, which had been updated. He sent me new motors, but the instructions also pointed out that the nut at the rear of the tuning cap shafts should be checked. The nut on the bottom tuning cap was definitely loose, which I think was the real cause of the problem (don't know for sure because by the time I checked it I had replaced the motors!) Since then, I've had a few random instances of tuning loss, which I think means the nut needs to be tightened again.

Hope this helps.

7104. Acom 2000A Question - retune

Yahoo group: acom-list (2010 — 2016)
Date: 2016-02-24 00:52:40 UTC
From: John Walker
Topic: 7104 Message: 7104

My amp is older vintage as well and I never have to retune. It’s legal limit on all bands.

I didn’t think that I needed to retune ever.

7105. ACOM 2000A Cabinet Screws

Yahoo group: acom-list (2010 — 2016)
Date: 2016-02-25 12:31:15 UTC
From: Jim Lawrence
Topic: 7105 Message: 7105

OK I have searched the archives and I know these screws are a problem. I don't see any definitive information for a source, size, etc. Can someone point me to a source for the screws used to secure the top cover on the Acom 2000A?

These are an unusual black metric Phillips head screw with a washer-like collar on the screw head.

I have lost, stripped, or broken a few of them over the years and would like to stock up on some original replacements.

Thanks and 73

Jim Lawrence W7CT

I have an Acom 2000a legal limit no tune amplifier. The unit functions 100% producing legal limit with about 40-45 watts drive depending on the band selected. I am the 2nd owner of this amp and it comes from a smoke free environment. It has the original style remote which was replaced under the factory warranty, so sorry no matching serial numbers :-(I am asking $4200 and would prefer not to ship. I can deliver within a couple hundred miles of Beaumont, Tx
The reason I am selling this amp is to pay for my new Expert Linear 2K-FA. Please call me at 4093519228 if you have any questions. I might consider a trade for a smaller solid state amp ie: KPA-500 OR ACOM 600S. I can possibly deliver to the Orange, Rayne, or Rosenberg hamfest. Thanks Lawrence KB5ZZB

I don't have any other information on sizing; they were only noted as computer screws. You'd need to caliper one of your existing screws for more info. I suspect that they are M2 or M2.5 and whatever length. Black, washer head.

Hi Adam,

Acom's authorized service center is:

ACOM Service Center - AVSL
829 Lynnhaven Parkway
Suite 128
Virginia Beach, VA 23452-7224
(757) 340-7143

Or

Array Solutions also still service Acom amps, although they don't sell them anymore.

Bill, only aware of one location and that's in Dallas. Call Jay Terelski or David. They'll take care of it and do a good job.

What's wrong with your switch? Little blue capacitors are a common point of failure.

Assuming you're out of warranty and depending on your skill level and willingness to do a little poking around, the problem could be something as simple as a shorted tube. There's also some good docs in the files section here showing common areas of failure and what to look for inside. Acom will even send you the parts. An inexpensive source for a pre-tested tube is Vine Antennas in the UK (an Acom dealer & service center themsleves). The tube is approx $225 from Vine ($160 British Pounds) & takes approx 2 weeks to arrive. Fuses can be obtained from Mouser or from Fry's Electronics.

Agree. You may try at least a simple unplugged troubleshooting if you are not ready for more. Read the ACOM 1010 files. Check the fuses current and time lag. Sometimes the fuses blow only because the are faster than needed. A broken down blue coin capacitor could be the short circuit culprit. Look every one for an unusual sign. Remove the tube and give the ACOM a try with no tube. Then get either a new tube or a new transformer.

7133. Acom 1000 fault code

Yahoo group: acom-list (2010 — 2016)
Date: 2016-03-09 15:14:48 UTC
From: spikepost@...
Topic: 7133 Message: 7133

Hi guys.
My Acom 1000 was ok first thing this morning, but after lunch. when I turned it back on, it decided to show a protection code fault of PN04.
I had a brief chat with the supplier in the UK here (the amp is several years old), and on his advice, opened her up, disconnected the HT supply (yellow lead), and fired it up again.
Still the same fault code.
His only suggestion was that it was a "logic board fault", or maybe the mains psu.
The amp does not go into countdown etc, simply flashes the fault code.
Anyone come across this code at all ??
I don't really want to give a dealer an "open cheque", to spend weeks finding a fault, with the associated large bill, without an idea of what the fault MIGHT be !
Oh, he also reckons the fault codes are nexr to useless !
Any advice / suggestions gratefully received.
73
Spike - G0CVL

From: spikepost@...
Topic: 7133 Message: 7135

Hi Bill, thanks for the prompt reply ! The full fault code is :-
1APN04 000000 0D0000
I'm slightly suprised by this appearing, as the amp has been in use for some 3 years here (although it is older than that), and bar a bit of tweaking now and again (new tube etc) has been faultless.
I was also a bit disappointing to learn the fault codes are virtually worthless !
Thanks again, and any advise welcome.
Cheers
Clive - G0CVL

Hi Spike,

the ACOM 1000 saves the last seven fault codes. Those are all basically the same. The one you first quoted was different from all of those. I suspect you have repeatedly induced the fault code and lost the original fault code from the amplifiers fault code memory. Did you record the full fault code for the first PN04 fault?

The fault is saying that it has detected a plate AC voltage greater than 40V during power up. A test with the valve removed would be interesting, for safety sake it is wise to remove the HV connection from the HV rectifier/filter module and tape it somewhere where it cannot drop back onto the HV rectifier/filter module that has lethal voltages present at all times.

Do not run the amplifier with HV disconnected and a valve fitted as that will destroy the valve.

ONLY DO THESE ANY TESTS WITH THE LID OFF IF YOU ARE COMFORTABLE AND EXPERIENCED WITH WORKING ON HIGH VOLTAGE DEVICES AND VALVE AMPLIFIERS. IF IN DOUBT DEFER TO AN EXPERT!

Hmmmm, interesting Bill. No, didn't save the first fault code, was to busy being puzzled to not mess about.
Likewise, the dealer recommended disconnecting the HT on the board rather than disconnecting the tube as well.
I've done that, so if the tube has gone, there's nothing I can do about that.
I have a spare tube, but obviously I don't want to risk that until I know a little more.
Ok, tomorrow, I'll disconnect the HT at the board again, AND pull the tube, and see what happens.
ARRRRGH all those screws in the PA cover again !!
I've changed the tube before Bill, so I'm ok with the procedure :-)

Hi Spike,

the issue with no HV on the anode is that the valve can conduct with the screen grid acting as a substitute anode, it is not robust enough to pass significant current. Fortunately the fault code indicates a fault was detected before the HV transformer was switched on, it is switched on by the firmware using the two relays on the mains board and the associated soft start circuitry once the basic switch on checks have been completed.

I'm not sure how an excessive AC voltage on the plate circuit can occur before the heater/grid/plate voltages are present. The obvious candidate, to me, is a fault in the measuring circuit. A test without the valve and no plate voltage on the top of the plate capacitive divider, that still fails, would add evidence to to that conjecture. The plate AC voltage measuring circuit is quite complex starting at the plate voltage capacitive divider by the valve, continuing with rectifying and conditioning circuitry on the input board under the socket and finishing on the control board where the voltage is measured.

A fault on the control board on the path between the input signal 'aavi' and the measured signal 'paav' would be a good place to start looking if the measuring circuit is suspect.

Bill,

We've seen the lack of plate voltage on a 1000 cause the very issue you describe. It appeared as a "SCREEN FAULT." The Resistors that were mentioned were probably those used in the measurement circuit. We've come across the problem in a 1500 where R1a and R1b had failed. I'll post a picture of those resistors although mounted in a 1500. Will post to this group in the files section under "AVSL."

Also, the amplifiers can be somewhat input voltage sensitive, Meter your A/C and set the taps as close to your actual line voltage as possible V/S just using the 240V taps out of habit. Our voltage was a bit low a few months ago when testing a 1010 after repair. and I kept getting a Screen Voltage error. Checked the voltage which was close to 220VAC and the taps in the amplifier were set for 240VAC. Set the transformer taps to 220VAC and it powered up and worked just fine.

7145. Acom 1011 sudden failure - no RF out but no fault lights

Yahoo group: acom-list (2010 — 2016)
Date: 2016-03-12 23:39:31 UTC
From: C. J. Shelton
Topic: 7145 Message: 7145

Hoping someone can suggest a next step in diagnosing my Acom 1011. This amp was working as it should for the two years I've owned it until about two weeks ago, when the two fuses on the back of the amp blew.

On replacing those fuses, the amp powered back up, but no longer amplified. No fault lights lit, but I can get no indication of any power out on the LEDs at any setting of plate or load, at any level of drive. The TX light does light when the amp is keyed, but no power out. If put into bypass, the power out LEDs do light at the appropriate level for the driver (50-100 watts), but nothing in Operate mode.

I've done the following, with no effect:

- tried both Ant 1 and Ant 2 outputs
- switched to a dummy load (verified 1:1 SWR for load)
- replaced coax and keying cables
- verified that transceiver was putting out normal drive power
- checked internal fuses on mains PCB board for continuity
- replaced relay K1 A,B (T/R relay)

Finally, I bought two brand new 4CX250Bs and replaced the tubes. When trying to adjust the bias, I found that there was NO setting of potentiometer RP1 that would produce ANY IP current reading - I went from full CW to full CCW, no plate current reading. So I went through all three service modes, and here's what I got:

G1 grid current: zero (no LEDs lit)
G2 grid voltage: 300 V (9 LEDs lit)
IP plate current: zero (no LEDs lit)

Any suggestions as to what's going on will be very much appreciated.

7153. TS-590S to Acom 1000 - Key Out // What is the function?

Yahoo group: acom-list (2010 — 2016)
Date: 2016-03-17 16:03:54 UTC
From: fairfam5@...
Topic: 7153 Message: 7153

In recently visited the idea of hooking up the Key Out RCA connection between my Kenwood TS-590S and a Acom 1000. I have the relay working fine using pin 5 (on the DIN - BRK) to ground. I see that there are cables available (ebay) that incorporate the Key IN RCA plug. In the Acom manual this connection is described to provide "a extra control signal from the amplifier to the transceiver. It could be used to improve the transmit/receive safety." What exactly is the action/reaction of this Key out signal? To clarify,... is this a ALC connection?
Also, what is the proper pin number to use in the DIN plug should I choose to incorporate this connection?
If I choose to abandon the whole idea of incorporating the connection, what feature of the transceiver/amplifier would I be missing?

Thank you for your consideration, advise and time.

What exactly is the action/reaction of this Key out signal? To clarify,... is this a ALC connection?
Also, what is the proper pin number to use in the DIN plug should I choose to incorporate this connection?
If I choose to abandon the whole idea of incorporating the connection, what feature of the transceiver/amplifier would I be missing?
Hi Les,

KEYOUT is not an ALC output, it is a transmitter inhibit signal that is grounded (I think) when no faults on the amplifier are detected. It is intended remove drive from the amplifier when the protection logic is triggered. Most protections override the KEYIN signal so I think this only helps when the input relay has failed in the Tx position or if an arc fault is detected in the aerial system. When the amplifier is in standby or Rx mode KEYIN is connected to KEYOUT.

I do not think there is a suitable input on the TS590. Most users do not connect the KEYOUT signal although where an exciter has such an input there is no harm in connecting it up. Yaesu rigs, for example, generally have a TX INH input on their LINEAR connector. The Yaesu TX INH is active high so is compatible with KEYOUT which is actually KEYOUT* (active low but active means Tx allowed).

7155. Heater Current too High

Yahoo group: acom-list (2010 — 2016)
Date: 2016-03-17 17:04:30 UTC
From: gm3yts@...
Topic: 7155 Message: 7155

when I use my Acom 2000a on 80m I have a problem. If drive exceeds 15 watts then I get a message heater voltage too high 4.6 a and the.amp switches off.

Now this happens with both my 80m Titanex Vertical and my 80m Dipole. All other antennas the amp works fine

SWR on both the 80m antennas are 1.5 to 1. Mains voltage is also OK

Any ideas out there ?

From: gm3yts@...
Topic: 7155 Message: 7157

Using autotune both 80m antennas are fine using 15 w of drive However 16w of drive and over the amp shuts down saying Heater voltage is too high. The amp works fine on all other antennas.

I then tried my Acom 1000 on both 80m antennas and got full power out no problem.

Any ideas before I contact Acom

It may be an Idea to check the amp in to a dummy load with all antennas disconnected in order to eliminate common mode RF problems. If all is well check all the interconnects for problems.

7160. Acom 1500 Menu Question

Yahoo group: acom-list (2010 — 2016)
Date: 2016-03-21 16:39:25 UTC
From: Robert Dorchuck
Topic: 7160 Message: 7160

I just received my Acom 1500 last week and a very nice amp indeed.

I do have a question about the off-line menu options. According to the manual I should have three options - Brightness Control, Auto-Operate selection and Antenna Output Assignment.

I do not have a Brightness Control option available. The other two work as described in the manual. Have there been a change to the amp not described in the manual or what? Anyone have any ideas?

Thanks
Bob W6VY

7165. Acom 2000A "Heater Current Too High" fault message

Yahoo group: acom-list (2010 — 2016)
Date: 2016-04-06 19:45:44 UTC
From: Craig Anderson
Topic: 7165 Message: 7165

I have an Acom 2000A (November 2014) with new RCU and this morning when I turned the amp on I received this message about 5 seconds into the warm-up cycle "Heater Current Too High 4.8 Amps" and the amp promptly shutdown. I looked in the manual and it indicated it could be a problem with the mains supply but I checked that and I had 248 volts on the plug. I hope it isn't a tube. Has anyone else had this issue and if so, what was your solution. I am dead in the water.

Craig W9CLA

Craig,

Same exact problem here except mine said 4.7 amp. The count down was at 137 seconds. It's at Array Solutions now and have not heard anything yet.

Mine is about 18 months old and has been absolutely a great amp until last week. First time I moved it or had the covers off since I got it.

check out : http://n1eu.com/acom/acom_prot.htm

great stuff on what you are looking for ,,,:

- MAINS (line input voltage, no protection is directly derived);
- FIL-V (filament voltage, 10V to 14.4V is acceptable);
- IF-REAR (filament current - rear tube, 3A to 4.4A is acceptable);
- IF-FRONT (filament current - front tube, 3A to 4.4A is acceptable);

The heater voltage protection would trip at voltages below 10V or over
14.4V, and the corresponding message to the operator is issued on the RCU.
Respectively, the thresholds for heater current protection are 3A and 4.4A,
and appropriate messages appear when tripped.

For your information, the nominal filament voltage is 12.6V, and the
nominal current is 3.6A. The "HEATER" indicator on the RCU is normally
dark. It will constantly light if the filament voltage drops below 11.6V,
and it will frequently blink if the voltage exceeds 13.6V (in order to
inform you that nearly half of the acceptable range is crossed). In both
cases the voltage selection may need to be changed if this conditions
predominate. See also p.11 below.

Hi Craig

I had the same issue where my amp would not turn on and gave the same error message.

My line voltage was fine at ~235 V but was the amp was reading it as considerably higher.

In my case it turned out to be a bad trimpot in the op amp circuit on the input to the adc and this was causing all of the adc readings to be in error.

Search the archives for my posts on this.

Thanks for the information. I don't remember my mains running this high on the past Normally it ran about 243-244 but I know that many power companies are upping their voltage on their transmission lines for various reasons and if this is what I am going to experience I don't know how to rectify the issue within the amp other than running a 240 VARIAC or Autotransformer and either solution is very expensive.

I will be patiently waiting for what Array Solutions finds wrong with your amp. After reading a bit more, I don't think my 249V line voltage is the issue. It can handle up to 264v on the high side. It would seem more logical that one of the tubes is for some reason drawing more heater current than it should and I am trying to think why that would occur unless there is a problem in the screen supply. I guess I will just have to wait until you hear from Array Solutions.

Most power companies have the ability to adjust the taps on the transformer feeding your home or a group of nearby homes. The steps are typically 2.5%, which is 6 volts at 240 VAC. Give their customer service number a call and tell them your voltage is high. They should send someone out to measure.

I went through this a while back, except that my voltage was low because my service drop landed in the middle of a long span. It took a few calls, but they eventually placed a transformer right at my drop and adjusted it properly. I'm now at 242 VAC, and it only sags a couple of volts during periods of heavy load.

Eric / WV3E

This one's a long shot, but I've seen the heater current message and others when I've turned on the amp while amp control software is running. Sometimes the CPU gets confused if it's bombarded with commands from a program during warm up. Doesn't happen every time.

If you use a software program to control the amp, pre-tune, etc., try unplugging the RS-232 cable from the amp before turning it on.

Was looking to get a spare set of GU74 for my ACOM 2000. I have 4 ACOM 2000 amps here.

Below is a reply from VINECOM out of EU who tests them before selling..

"Price is GBP350 for a pair but right now we have trouble in getting them and there is a massive QRX list. I can put you on it if you like but at this time cannot even estimate a time scale for delivery."

Hi Rich & all,

I spoke to Ron at Vine recently about this as well. He explained that suppliers of NOS GU74/4CX800 are now unwilling to accept returns for dead on arrival items. For outlets like Vine who test, match and give a warranty this effectively doubles the purchase price as a 50% failure rate on NOS GU74/4CX800 is not uncommon.

Guys,
We just got in 30 tubes and have tested all of them in our tester, which is a modified ACOM amp.
We were able to get many matched sets.

My experienced with my supplier in St. Petersburg has been good. This batch had 1 tube that is weak and we will return it.

7184. Screen current too high' ig2 17mA - Fixed?

Yahoo group: acom-list (2010 — 2016)
Date: 2016-04-08 21:06:42 UTC
From: Terry Burbidge
Topic: 7184 Message: 7184

During CQWPX SSB we lost my Acom 2000 (1998 vintage) due to 'Screen current too high' 'ig2=17mA should be zero' error.

Val at Acom pointed me towards the HVBSG board. Checked out the capacitors and all appear to be ok with a simple multimeter test. I also checked D32 as an obvious candidate but that appears to be well forward biased.

So, decided to trace the screen current measurement circuit back from the CPU g2 ci. First component on the HVBSG board from JP5:4 is R26. That measured ok according to its marking (1k) but circuit diagram shows value of 100k Ohms. I replaced R26 with a 100k resistor, powered up the amp all ok, no ig2 error.

I've asked Val for his thoughts since I don't understand how it has worked for the 7 years that I have owned the amp with this resistor of the incorrect value. The component looks the same vintage as the other resistors (yes, very subjective I know but that's all I have to go on) but possibly replaced by a previous owner who mistakenly put a 1k in to match R27?

Is it possibly the tube anodes internal leakage maybe changing the characteristics? Out of my depth now.

I'm soak testing the amp and will report back if further work done.

Cheers,

Terry/G4MKP

7187. Acom 1000 failure

Yahoo group: acom-list (2010 — 2016)
Date: 2016-04-10 01:47:18 UTC
From: Bry Carling
Topic: 3059 Message: 7187

Hi folks,

I have a second hand Acom 1000 that ran fine for a few weeks after I bough tit...

Now it won't work. It always gives the TR2B fault code and will
not transmit.

Even in the low power TRI mode. Has to be reset and try again.
Then no go.

I think my next amplifier will be an SPE
Expert self-tuning amplifier!

Still I would love to fix this one. It seems like most HF
amplifiers are prone to failure

no matter who makes them!

ERROR CODES I see:

1AT2B 010000 000000
1BB396 7732DD D77F9F

2ATR2B 000000 000100
2BB299 77BADD D77F18

3ATR2B 000000 000100
3BB399 77BADD D77F18

4ATR2B 3D0900 42010A
4BA79D 7732D5 D77FF5

5ATR2B 000100 000100
5BB299 77BAD5 D77F11

6ATR4B 4E0000 4E0108
6BA89D 7733DD D37FE3

7ATR2B 000000 000100
7BB398 7732DD 077F90

So that's it folks.
I guess this is bad news and whatever this means it will probably be expensive!

I read the procedure for changing out the vacuum relay with a torque wrench etc. and I sure hope I don't have to try that!! This sounds like an expensive repair, sigh.
These things seem way too complicated. It just means there is more to go wrong.

Maybe I should just have gone with something simple like an AL811H or AL80B - sigh!
I love the QSK and 6m on this one, but I haven;t really had a chance to use it much thanks to this failure!

Any clues from those out there with experience please? Where do you send them when they break?
Is this worth fixing? Maybe it is something simple I can do myself (?) - hope.

73 to all - Bry Carling, AF4K
Sanford, FL

Bry

As an overall satisfied A1000 owner I must say this is generally a great amplifier and sometimes easy to work on but somewhat more complex than legacy amplifiers.

I order to do anything in terms of understanding the problem you will need the spreadsheet to analyse the problem. I am attaching that to the message.

I plugged in your data and you have probably narrowed it down - looks like your Output relay is closed - ORC.

It might not be a bad idea to give the folks at Array Solutions a call. They don't sell these amps anymore but as far as I'm aware they will/can still service these amps. I've had a couple serviced there and always a great experience. I am not clear on it but DX Engineering does also see the amp but it is not clear if they also do service. If they do i am sure they would also be great as W5OV is very familiar with these amps.

If you need any additional info you could also contact the factory - Val is great and has also walked me through a couple probs in the past via email.

The amp though is no doubt worth trouble-shooting and repairing whether you can do it yourself or have to ship for the repair.

I do have just about anything I could find online about the amp and if you need anything feel free to contact me directly.

regards

Hi Bry,

several of those fault codes are invalid, you probably mistyped a digit. The ones that are valid all show the same fault which is ORC at logic low when going to Tx and the invalid ones look to be the same. Vacuum relays are mechanical and therefore subject to wearing out so the output relay may well have failed. Obviously driving full power into an open circuit is not desirable, hence the diagnostic check in the amplifier.

The ORC signal is ultimately derived from a DC path to ground through RFC3, the vacuum relay K1 normally open contacts and RFC4. The *ORC line is pulled up to 24V through R26 on the control board. The ORC logic signal is *ORC inverted and converted to 5V by Q5 on the control board. If that path to ground through the relay is not present when K1 is switched to Tx (*PANT signal low which is the K1 switch to Tx signal) then the amplifier knows there is a problem and it trips the fault.

The fault detecting circuit itself may be faulty but it is pretty simple and I suspect that a relay failure is more likely.

Details of changing the vacuum relay along with pictures are here:

Hi Bry,

vacuum relays are pretty much essential for near noise free QSK operation and similar relays are used in most high power QSK linears. ACOM cannot be blamed for a relay failure, they have used same part that any designer would have used. It is unfortunate to have a failure but traffic here and elsewhere show that it is not a common fault.

NOS suppliers show the Russian PWD-1W relay available for around $25. Alternatively the Kilovac HC1-26/HC1-U26 or Jennings RJ1A-26S seem to be readily available for less than $100. Considering the cost of the amplifier I can't imagine a repair will be that expensive although shipping costs are not trivial.

Is there any possibility that this problem could be called by the control circuit for the relay?

Bry,

I have owned both. Both the SPE 1K and the Acom 1000 are amazing amps. Of course the SPE 1K has autotuner that works FB once set up, remote capability and four antenna outputs but is about 2x the cost. I think the Acom is way more rugged.

Once you get it up and running again you will be happy. I did run into error codes on my Acom. Did you happen to change the supply voltage on it when you got it. I did it incorrectly on mine and was receiving errors when in all actuality it was fine. I just thought I would mention it

Good luck!

Thank you Keith. Mine is set up for 240 V AC. And I'm running on that. Thank you for the encouragement. Part of the problem may be that I was not tuning it correctly? It seems rather complicated to use that TR I method.

Is there any possibility that this problem could be called by the control circuit for the relay? Hi Bry,

that boils down to the MOSFET Q4 on the control board, it is used to switch both the RF input relay and the vacuum output relay. That seems unlikely to fail.

One thing worth checking is that there is no external switching issue, does the fault happen if you disconnect the RF input and keying line and simply short the KEY IN line?

TRI complicated! That is a challenging comment. I have a pice of paper with my band/tune/load numbers on it and preset. Thereafter it takes a couple of seconds to trim up.

The ORC signal is ultimately derived from a DC path to ground through RFC3, the vacuum relay K1 normally open contacts and RFC4. The *ORC line is pulled up to 24V through R26 on the control board. The ORC logic signal is *ORC inverted and converted to 5V by Q5 on the control board. If that path to ground through the relay is not present when K1 is switched to Tx (*PANT signal low which is the K1 switch to Tx signal) then the amplifier knows there is a problem and it trips the fault. Hi Bry & all,

I should correct this. The *PANT signal is not the SEND switch, that is T/*R and that drives *OUTR which grounds the K1 vacuum relay coil to switch to SEND. The *PANT signal goes low when forward power is detected at the output watt meter bridge. So the TR2B fault condition is when RF power is detected with T/R* high but the output vacuum relay has not yet switched to the SEND position (ORC low).

Sounds to me more like Vine may be trying to justify a price hike commensurate with what Array gets for them. For quite a while Array has been getting US $350 per tube, and US $600 for a matched pair. As recent as last month (March) VINE was selling them singly for US $225 shipped from the UK. Check other sources. QRO-Parts dot com currently has them for US $ 199.50 (plus shipping from Sweden).

I find it really hard to believe claims of a 50% failure rate

I would expect the fault not to occur until RF is applied to the input. You should be able to hear the relays clicking when you short the KEY IN jack. You may be able to hear the vacuum relay which is just behind the front and side panel at the bottom left side of the front panel. It will be pretty quiet so you may not be able to hear that one, the input relay is probably a bit noisier. If you hear any relay noise then the switching circuit (control board Q4) is definitely OK.

Next thing to try is to apply a bit of RF to the input after shorting the KEY IN jack. The fault will probably happen as soon as the RF is applied.

I drive my A1000 with a K3, no ALC connected. I have set the "tune power" from the K3 to 20W. Using the TRI I don't find any difference between tuning at 20W or 50W. Recently I have taken to keeping the loading slightly on the heavy side, TRI indicator slightly to the left of centre. Safer for the screen grid (g2).

Regards,

Mike VP8NO

Thanks fellas...

Triggering it with no RF input - I can hear a relay clicking inside the Acom and of course noerror message iwth no RF applied.

So it looks like I need to buy a relay then.
I might open it up and see if voltage is going to that relay first.
Does that sound like a good idea?

Does that sound like a good idea? Hi Bry,

you have verified that the relay control circuit is working (control board Q4). The +48V supply that switches it is checked by the amplifier (the PSE Power Supply Error signal) so you would have a different fault code if that was missing.

I think the relay coil connections are tricky to get at in situ as they are behind the relay mounting plate. IMHO it is fairly certain that the relay has failed.

Sorry for the late comments but I don't look at this group too often. Nobody has mentioned that there is another possibility. Looking at the schematic shows 2 inductors RFC3 and RFC4 which are used to determine if the contacts of the output vacuum relay have actually closed. This measurement happens after keying the amp and before any RF is present. These inductors are labelled in the schematic as 60uH which is only +j678 ohms at 1.8MHz. One of them might have opened up making the amp think that the relay is dead or the contacts are bad. This approach has been used by Alpha on several amps and allows the amp to determine if the output relay is bad and if RF is present before the output relay closes. Operating the amp into an SWR which is higher than 50 ohms stresses the inductors more. It is easy to ohm them out to see if they are good.

73,
Larry, W0QE

Hi Larry,

good point. The last two pictures in this document nicely show the location of the two chokes:

https://xa.yimg.com/df/acom-list/ACOM1000-Cover-Removal2.doc?token=GQwQiZkFQBFmmNIakEqGjYFWSBZkEQOscdcKQL4MtuqHgJFUHLRjJyZ29j3LrH0giIaox3Hmnw0VAqfiJCHVRqIskmnm3Fuv5-GAOnQ2IKAwRbhf6Lrchhfh&type=download https://xa.yimg.com/df/acom-list/ACOM1000-Cover-Removal2.doc?token=GQwQiZkFQBFmmNIakEqGjYFWSBZkEQOscdcKQL4MtuqHgJFUHLRjJyZ29j3LrH0giIaox3Hmnw0VAqfiJCHVRqIskmnm3Fuv5-GAOnQ2IKAwRbhf6Lrchhfh&type=download

An open RFC4 would be particularly worrying since is acts a plate supply crowbar, to keep the HV away from the aerial socket, should the C3b doorknob blocking capacitor fail short.

HEED ALL THE WARNINGS IN THE ABOVE DOCUMENT IF YOU INTEND TO REMOVE THE COVERS!! LETHAL VOLTAGES ARE PRESENT AND MAY STILL BE PRESENT AFTER DISCONNECTING FROM THE MAINS.

Hi I wish to purchase a spare vacuum output relay for my 1000 .Can anyone tell me the relay ohms and the switching voltage.A point in the right direction for replacement type relays would be appreciated .
Thanks Morrie

Hi Morrie,

These are all compatible I believe:

NOS suppliers show the Russian P1D-1W relay available for around $25. Alternatively the Kilovac HC1-26/HC1-U26/HC1-S122 or Jennings RJ1A-26S seem to be readily available for less than $100.

The relay is SPDT 3A 300V @76MHz with a 26.5V DC coil at 335 Ohm resistance and ~10ms switching time. It is driven by a +48V DC supply with 2 times 82 Ohm a 330 Ohm plus a diode and a MOSFET switch in series. So the coil voltage is ~29V DC which is in spec for those relays.

Morrie

It is a 24V Dc relay.
Kilovac, Jennings, Gigavac, or Siemens vr311
The last one you can find on ebay.de a good supplier is Osttech.

7218. Acom 2000A Problem

Yahoo group: acom-list (2010 — 2016)
Date: 2016-04-16 20:06:44 UTC
From: George
Topic: 1828 Message: 7218

My 2000A will not produce any RF output. HV, Bias, and grid voltages look normal. I manual keyed the rig by shorting the input connector and I can hear the relay key. Also the Bias drop from -127 to around -74 when keyed without an input signal. HV drops slightly to about 2.85KV when keyed. There are no fault codes. Amp worked perfectly when last used.

When keyed with the rig the output power folds back to almost 0 watts input SWR is almost 30:1.

Any suggestion as to where to start digging into the problem?

73, George
W2GS

7219. No output

Yahoo group: acom-list (2010 — 2016)

From: K2LS
Topic: 7219 Message: 7219

Check the VSWR on the Driver connected to a dummy or good known load.

Replace the coax between the driver and amp. (They do go bad)

Is it within "normal limits"

Does it change while radio is keyed?

I hope it's a simple fix.

73, Larry K2LS

Thanks for the input. Turned out to be a switching problem in the
system I use to connect my rigs and amps together. I haven't got into
to that yet, but glad it's not the amp. Amp is 10 years old and still
going strong.

Hello

Is it possible to empty a tube with just the amplifier into standby mode ?
If it is possible in this mode, how long it takes for a good degassing ?

Thank's,

Thierry

From: bill.8@...
Topic: 7222 Message: 7223

Hi Thierry,

There is full HV on the anode even on standby and although there is off bias on the grid, that should stop conduction, I do not think I would trust a potentially soft vacuum valve with full HV.

It is pretty easy to hack together a degassing rig from stuff on the workbench. All you need is a variable voltage PSU capable of 12.6VDC at 4A and a source of airflow. I recently used a soldering fume extractor and a simple cardboard and packing tape chimney arrangement, it took less that half an hour to hack together.

I think a day at normal filament voltage is sufficient to degas. The valve does not get very hot on filament only so air flow may not be necessary but just in case since the vacuum seal is quite delicate.

I believe external RF heating is used to heat the getter during manufacturing.

I have posted a picture of my set up to the galleries here.

Thierry

It is posseble to burn in the gu74b inside the acom 1000, but it is not the best thing to do with an expensive
amplifier. There can be internal shorts in a new or NOS tube and you can damage parts.

As described it is best to getter the tube external as written in another reply.

Some more hints:
- before you put the tube in to a test , measure for any shorts between the internal wires : grid-sreen-anode
- ramp up the voltage slowly from 6v for 2 H, to 10 V , to 12,5 V for 5 to 10h
- meaures again for internal shorts, shortly after deconneting the voltage, the tube is warm .
the most likely short is an kathode to grid short, hot kahtodes can bend ant touch the grid.
- if this all ok, than put in the amp.
- the amplifier must be stand by for a couple of hours , let s say 2 h. , anode voltage is on.
there can be a internal flash , if this occurs then burn in the tube external - or in the amp without any anode voltage - for longer time 12,5 V for 24 h . With some the tube will have no flashes any more. If not , it is a bad tube.
internal flashes happens when the tube is not degassed for 100 %
- let run the amp in idle, there will be a current flow from kathode to anode : 1 h
- set the bias , on this reflector there is document in the files for to do this.
- let run the amp at some low power : 5w in , cw 50 % duty cycle , a couple of minutes
- the tube is ready for use

warning : lethal voltage inside the amp.

This is the way I do it with nos russian tetrodes.

In the file section you find also some info for to set up a nos tube

HI Bob,
The Agents for Acom over here in Australia, Posnav have just shipped their first Acom 2100 to VK4 so they are now shipping from Bulgaria to dealers around the world.
Reviews from the VK4 station on the Acom 2100 are going to be available soon as I am very interested in his feedback, but initial comments from the customer expressed a desire to complement the Team at Acom in Bulgaria on a job well done..
Cheers

I just came across this... http://www.mwe.dk/A1200.PDF

I just became a member of the ACOM 1000 owner family.

Question: My amp's LCD has a black background with yellow characters. Is this new?
Every amp I had seen before has a green background with black characters.

Thanks.

Sounds to me more like Vine may be trying to justify a price hike commensurate with what Array gets for them. For quite a while Array has been getting US $350 per tube, and US $600 for a matched pair. As recent as last month (March) VINE was selling them singly for US $225 shipped from the UK. Check other sources. QRO-Parts dot com currently has them for US $ 199.50 (plus shipping from Sweden).

I find it really hard to believe claims of a 50% failure rate
